325	1 Introduction	
326		
327	This document describes the LoRaWAN® regional parameters for different regulatory regional	
328	worldwide. This document is a companion document to the various versions of	the

LoRaWAN® MAC Layer Protocol Specification [TS001]. Separating the regional parameters from the protocol specification allows addition of new regions to the former without impacting the latter document.

331 332 333

334

329

330

This document combines regional parameters aspects defined in all LoRaWAN® protocol specifications, with differences arising from LoRaWAN® versions highlighted at each occurrence.

335 336 337

338

339

Where various attributes of a LoRa transmission signal are stated with regard to a region or regulatory environment, this document is not intended to be an authoritative source of regional governmental requirements and we refer the reader to the specific laws and regulations of the country or region in which they desire to operate to obtain authoritative information.

340 341 342

It must be noted here that, regardless of the specifications provided, at no time is any LoRaWAN® equipment allowed to operate in a manner contrary to the prevailing local rules and regulations where it is expected to operate. It is the responsibility of the LoRaWAN® enddevice to ensure that compliant operation is maintained without any outside assistance from

a LoRaWAN® network or any other mechanism.

1.1 Conventions

348 349

350

351

347

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

352 353 354

The tables in this document are normative. The figures in this document are informative. The notes in this document are informative.

355

356

1.2 Country Cross Reference Table

- 357 358
- In order to support the identification of LoRaWAN® channel plans for a given country, the table below provides a quick reference of unlicensed frequency bands and suggested channel

The table also provides an indication of the existence of known end devices that are

- 359 plans available to implementors for each country.
- 360
- Please note that countries listed using italic font are expected to have changes made to their local regulations and thus the specified channel plan may change. 361

LoRaWAN® certified with Regulatory Type Approval in the given country.

362 363

364

1.3 Regional Parameters Summary Table

The following summary tables have been provided as a quick reference to the various parameters described and defined, by channel plan region, in this document of the authoritative and normative text. The information is further broken down by channel plan type: dynamic channel plans, in which the major in LoRaWAN® versions prior to 1.1.1) of channels are defined statically and known prior to the join process.

1.3.1 Dynamic Channel Plan Regions

Plan	EU868	CN779	EU433	IN865	KR920	
Default Freq band	863 to 870 MHz	779 to 787 MHz	433 to 434	865 to 867 MHz	920.9 to 923.3 MHz	915 to
	868.10 MHz	779.5 MHz	433.175 MHz	865.0625 MHz	922.10 MHz	923.20
Mandatory Channel Freq (Join Req)	868.30 MHz	779.7 MHz	433.375 MHz	865.4025 MHz	922.30 MHz	923.40
	868.50 MHz	779.9 MHz	433.575 MHz	865.985 MHz	922.50 MHz	
JoinReq DataRate [MinDR:MaxDR]	[0:5]	[0:5]	[0:5]	[0:5]	[0:5]	[2:5]
CFList Type Supported	0	0	0	0	0	0
Mandatory Data Rate [MinDR:MaxDR]	[0:5]	[0:5]	[0:5]	[0:5]	[0:5]	[0:5]
Optional Data Rate [MinDR:MaxDR]	[6:7] [6:11]	[6:7]	[6:7]	[7]		[6:7]
Number of channels	16	16	16	16	16	16
ChMaskCtrl - ChMask	0 -> Channels 0-15	0 -> Ch				
ChiviaskCtri - Chiviask	6 -> All channels on	6 -> All				
Default channels	[0:2]	[0:2]	[0:2]	[0:2]	[0:2]	[0:1]
Default RX1DRoffset	0	0	0	0	0	0
Allowed RX1DRoffset	[0:5]	[0:5]	[0:5]	[0:7]	[0:5]	[0:7]
Duty Cycle	< 1%	< 1%	< 10%		LBT	< 1%
Dwell time limitation	No	No	No	No	No	Yes (40
TxParamSetupReq support	No	No	No	No	No	Yes
Max EIRP (default) - TXPower 0	+16 dBm	+12 dBm	+12dBm	+30 dBm	+14 dBm	+16 dB
Default RX2DataRate	DR0	DR0	DR0	DR2	DR0	DR2
Default RX2 Frequency	869.525 MHz	786.0 MHz	434.665 MHz	866.550 MHz	921.90 MHz	923.2 N
Class B default Beacon Freq	869.525 MHz	785.0 MHz	434.665 MHz	866.550 MHz	923.1 MHz	923.4 N
Class B default downlink pingSlot Freq	869.525 MHz	785.0 MHz	434.665 MHz	866.550 MHz	923.1 MHz	923.4 N

Table 2 - Dynamic Channel Plans Summary

1.3.2 Fixed Channel Plan Regions

Plan	US915	AU915
Default Freq band	902 to 928 MHz	915 to 928 MHz
Mandatory Channel Freq (Join Req)	upstream: 64 (902.3 to 914.9 [+ by 0.2]) + 8 (903.0 to 914.2 [+ by 1.6]) downstream: 8 (923.3 to 927.5 [+ by 0.6])	upstream: 64 (915.2 to 927.8 [+ by 0.2]) + 8 (915 downstream: 8 (923.3 to 927.5 [+ by 0.6])
JoinReq DataRate [MinDR:MaxDR]	64 (125 kHz channels) using DR0 and 8 (500 kHz channels) using DR4	64 (125 kHz channels) using DR2 and 8 (500 kHz channels) using DR6

389 390

391 392

2.2 Regional Parameter Revision Names

In order to support the identification of Regional Parameter Specification versions referenced by other specification documents, the table below provides a quick reference of common revision strings listed for each formal revision number.

Specification Revision	Notes
LoRaWAN® v1.0.1	Originally integrated in the LoRaWAN® spec
Regional Parameters v1.0.2rB	Aligned with LoRaWAN® 1.0.2
Regional Parameters v1.0.3rA	Aligned with LoRaWAN® 1.0.3
Regional Parameters v1.1rA	Aligned with LoRaWAN® 1.1
RP002-1.0.0	Supports both LoRaWAN® 1.0.x and 1.1.x
RP002-1.0.1	Supports both LoRaWAN® 1.0.x and 1.1.x
RP002-1.0.2	Supports both LoRaWAN® 1.0.x and 1.1.x
RP002-1.0.3	Supports both LoRaWAN® 1.0.x and 1.1.x

Table 5 Regional Parameter Revision Names

393

394

2.3 Default Settings

The following parameters are RECOMMENDED values for all regions.

RECEIVE_DELAY1 1s

RECEIVE_DELAY2 2s (SHALL be RECEIVE_DELAY1 + 1s)

The authors reserve the right to change specifications without notice.

⁸ AS923 has been renamed AS923-1 as of RP002-1.0.2, however, the common name remains the same

table index)

JOIN_ACCEPT_DELAY1 5s JOIN_ACCEPT_DELAY2 6s MAX_FCNT_GAP⁹ 16384 ADR_ACK_LIMIT 64 ADR_ACK_DELAY 32

RETRANSMIT_TIMEOUT 2s +/- 1s (random delay between 1 and 3 seconds)
DownlinkDwellTime 0 (No downlink dwell time enforced, impacts data rate

Offset calculations)

UplinkDwellTime Uplink dwell time is country specific and is the

responsibly of the end-device to comply with

PING_SLOT_PERIODICITY $7 (2^7 = 128s)$

PING_SLOT_DATARATE The value of the BEACON DR defined for each regional

band

PING_SLOT_CHANNEL Defined in each regional band

CLASS_B_RESP_TIMEOUT 8s¹⁰ CLASS C RESP TIMEOUT 8s¹¹

396 397

398 399

400

If the actual parameter values implemented in the end-device are different from those default values (for example the end-device uses a longer JOIN_ACCEPT_DELAY1 and JOIN_ACCEPT_DELAY2 latency), those parameters SHALL be communicated to the network server using an out-of-band channel during the end-device commissioning process. The network server may not accept parameters different from those default values.

401 402 403

404

RETRANSMIT_TIMEOUT was known as ACK_TIMEOUT in versions prior to 1.0.4 of LoRaWAN® specification. It is renamed in version 1.0.4 and subsequent versions of the LoRaWAN® specification to better reflect its intended use.

405 406 407

408

409

410

MAC commands exist in the LoRaWAN® specification to change the value of RECEIVE_DELAY1 (using RXTimingSetupReq, RXTimingSetupAns) as well as ADR_ACK_LIMIT and ADR_ACK_DELAY (using ADRParamSetupReq, ADRParamSetupAns). Also, RXTimingSettings are transmitted to the end device along with the JOIN ACCEPT message in OTAA mode.

411 412 413

The default values for PING_SLOT_PERIODICITY, PING_SLOT_DATARATE, and PING SLOT CHANNEL can be adjusted using Class B MAC commands.

414 415

⁹ MAX_FCNT_GAP was deprecated and removed from LoRaWAN® 1.0.4 and subsequent versions
¹⁰ CLASS_B_RESP_TIMEOUT must always be greater than the largest possible value of RETRANSMIT_TIMEOUT plus the maximum possible time-on-air of an uplink frame
¹¹ CLASS_C_RESP_TIMEOUT must always be greater than the largest possible value of RETRANSMIT_TIMEOUT plus the maximum possible time-on-air of an uplink frame

2.4 EU863-870 MHz Band

2.4.1 EU863-870 Preamble Format

418 Please refer to Section 3.0 Physical Layer.

2.4.2 EU863-870 Band Channel Frequencies

This section applies to any region where the radio spectrum use is defined by the ETSI [EN300.220-2] standard.

The network channels can be freely attributed by the network operator. However, the three following default channels SHALL be implemented in every EU863-870 end-device. Those channels are the minimum set that all network gateways SHALL be listening on.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	868.10 868.30 868.50	DR0 to DR5 / 0.3-5 kbps	3	< 1%

Table 6: EU863-870 default channels

In order to access the physical medium, the ETSI regulations impose some restrictions such as the maximum time the transmitter can be on or the maximum time a transmitter can transmit per hour. The ETSI regulations allow the choice of using either a duty-cycle limitation or a so-called **Listen Before Talk Adaptive Frequency Agility** (LBT AFA) transmissions management. The current LoRaWAN® specification exclusively uses duty-cycled limited transmissions to comply with the ETSI regulations.

EU868 end-devices SHALL be capable of operating in the 863 to 870 MHz frequency band and SHALL feature a channel data structure to store the parameters of at least 16 channels. A channel data structure corresponds to a frequency and a set of data rates usable on this frequency.

The first three channels correspond to 868.1, 868.3, and 868.5 MHz / DR0 to DR5 and SHALL be implemented in every end-device. For devices compliant with TS001-1.0.x, those default channels SHALL NOT be modified through the **NewChannelReq** command. For devices compliant with TS001-1.1.x and beyond, these channels MAY be modified through the **NewChannelReq** but SHALL be reset during the backoff procedure defined in TS001-1.1.1 to guarantee a minimal common channel set between end-devices and network gateways.

The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message. The Join-Request message transmit duty-cycle SHALL follow the rules described in chapter "Retransmissions back-off" of the LoRaWAN® specification document.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels
LoRa	125	868.10 868.30 868.50	DR0 – DR5 / 0.3-5 kbps	3

Table 7: EU863-870 Join-Request Channel List

2.4.3 EU863-870 Data Rate and End-device Output Power encoding

There is no dwell time limitation for the EU863-870 PHY layer. The *TxParamSetupReq* MAC command is not implemented in EU863-870 devices.

The following encoding is used for Data Rate (DR) and End-device EIRP (TXPower) in the EU863-870 band:

453	
454	

452

449

Data Rate Configuration		Indicative physical bit rate [bit/s]
0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980
3	LoRa: SF9 / 125 kHz	1760
4	LoRa: SF8 / 125 kHz	3125
5	LoRa: SF7 / 125 kHz	5470
6	LoRa: SF7 / 250 kHz	11000
7	FSK: 50 kbps	50000
8	LR-FHSS ¹² CR1/3: 137 kHz BW	162
9	LR-FHSS CR2/3: 137 kHz BW	325
10	LR-FHSS CR1/3: 336 kHz BW	162
11	LR-FHSS CR2/3: 336 kHz BW	325
1214	RFU	
15	Defined in [TS001] ¹³	

Table 8: EU863-870 TX DataRate table

455 456 457

458 459

460 461 EU863-870 end-devices SHALL support one of the 3 following data rate options:

- 1. DR0 to DR5 (minimum set supported for certification)
- 2. DR0 to DR7
- 3. DR0 to DR11 (all data rates implemented)

For each of the 3 options all data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

462 463 464

465 466 When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

DRcurrent	DRnext	Comment
0	NA	Already the lowest data rate
1	0	
2	1	
3	2	
4	3	
5	4	
6	5	
7	6	
8	0	
9	8	
10	0	
11	10	

¹² Long Range Frequency Hopping Spread Spectrum, see Section 4.3

¹³ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN1.0.4 and subsequent specifications and were previously RFU

Table 9: EU863-870 Data Rate Backoff table

EIRP¹⁴ refers to the Equivalent Isotropically Radiated Power, which is the radiated output power referenced to an isotropic antenna radiating power equally in all directions and whose gain is expressed in dBi.

TXPower	Configuration (EIRP)
0	Max EIRP
1	Max EIRP – 2dB
2	Max EIRP – 4dB
3	Max EIRP – 6dB
4	Max EIRP – 8dB
5	Max EIRP – 10dB
6	Max EIRP – 12dB
7	Max EIRP – 14dB
814	RFU
15	Defined in [TS001]

Table 10: EU863-870 TX power table

By default, the Max EIRP is considered to be +16 dBm. If the end-device cannot achieve 16 dBm EIRP, the Max EIRP SHOULD be communicated to the network server using an out-of-band channel during the end-device commissioning process.

2.4.4 EU863-870 Join-Accept CFList

 The EU863-870 band LoRaWAN® implements an OPTIONAL channel frequency list (CFlist) of 16 octets in the Join-Accept message.

In this case the CFList is a list of five channel frequencies for the channels three to seven whereby each frequency is encoded as a 24 bits unsigned integer (three octets). All these channels are usable for DR0 to DR5 125 kHz LoRa modulation. The list of frequencies is followed by a single CFListType octet for a total of 16 octets. The CFListType SHALL be equal to zero (0) to indicate that the CFList contains a list of frequencies.

Size (bytes)	3	3	3	3	3	1
CFList	Freq Ch3	Freq Ch4	Freq Ch5	Freq Ch6	Freq Ch7	CFListType

The actual channel frequency in Hz is 100 x frequency whereby values representing frequencies below 100 MHz are reserved for future use. This allows setting the frequency of a channel anywhere between 100 MHz to 1.678 GHz in 100 Hz steps. Unused channels have a frequency value of 0. The **CFList** is OPTIONAL and its presence can be detected by the length of the join-accept message. If present, the **CFList** SHALL replace all the previous channels stored in the end-device apart from the three default channels. The newly defined channels are immediately enabled and usable by the end-device for communication.

2.4.5 EU863-870 LinkAdrReq command

The EU863-870 LoRaWAN® only supports a maximum of 16 channels. When **ChMaskCntl** field is 0 the ChMask field individually enables/disables each of the 16 channels.

ChMaskCntl	ChMask applies to	
0	Channels 0 to 15	

¹⁴ ERP = EIRP – 2.15dB; it is referenced to a half-wave dipole antenna whose gain is expressed in dBd

2	RFU
3	RFU
4	RFU
5	RFU
6	All channels ON: The device SHALL enable all currently defined channels
	independently of the ChMask field value.
7	RFU

Table 11: EU863-870 ChMaskCntl value table

If the ChMaskCntl field value is one of values meaning RFU, the end-device SHALL¹⁵ reject the command and unset the "**Channel mask ACK**" bit in its response.

2.4.6 EU863-870 Maximum payload size

The maximum **MACPayload** size length (*M*) is given by the following table. It is derived from limitation of the PHY layer depending on the effective modulation rate used taking into account a possible repeater encapsulation layer. The maximum application payload length in the absence of the OPTIONAL **FOpts** control field (*N*) is also given for information only. The value of N MAY be smaller if the **FOpts** field is not empty:

Data Rate	M	N
0	59	51
1	59	51
2	59	51
3	123	115
4	230	222
5	230	222
6	230	222
7	230	222
8	58	50
9	123	115
10	58	50
11	123	115
12:15	Not de	efined

Table 12: EU863-870 maximum payload size (repeater compatible)

If the end-device will never operate with a repeater then the maximum application payload length in the absence of the OPTIONAL **FOpts** control field SHALL be:

Data Rate	M	N
0	59	51
1	59	51
2	59	51
3	123	115
4	250	242
5	250	242
6	250	242
7	250	242
8	58	50
9	123	115
10	58	50

2.4.7 EU863-870 Receive windows

By default, the RX1 receive window uses the same channel as the preceding uplink. The data rate is a function of the uplink data rate and the RX1DROffset as given by the following table. The allowed values for RX1DROffset are in the [0:5] range. Values in the [6:7] range are reserved for future use.

Upstream data rate	Downstream data rate in RX1 slot					
RX1DROffset	0	1	2	3	4	5
DR0	DR0	DR0	DR0	DR0	DR0	DR0
DR1	DR1	DR0	DR0	DR0	DR0	DR0

2.5 US902-928 MHz ISM Band

This section defines the regional parameters for the USA, Canada and all other countries in ITU Region 2 adopting the entire FCC 47 CFR Part 15regulations in 902-928 ISM band.

2.5.1 US902-928 Preamble Format

Please refer to Section 3.0 Physical Layer.

2.5.2 US902-928 Band Channel Frequencies

The 915 MHz ISM Band SHALL be divided into the following channel plans.

- Upstream 64 channels numbered 0 to 63 utilizing LoRa 125 kHz BW varying from DR0 to DR3, using coding rate 4/5, starting at 902.3 MHz and incrementing linearly by 200 kHz to 914.9 MHz
- Upstream 8 channels numbered 64 to 71 utilizing LoRa 500 kHz BW at DR4 or LR-FHSS 1.523 MHz BW at DR5-DR6 starting at 903.0 MHz and incrementing linearly by 1.6 MHz to 914.2 MHz
- Downstream 8 channels numbered 0 to 7 utilizing LoRa 500 kHz BW at DR8 to DR13, starting at 923.3 MHz and incrementing linearly by 600 kHz to 927.5 MHz

Figure 1: US902-928 channel frequencies

915 MHz ISM band end-devices are required to operate in compliance with the relevant regulatory specifications, the following note summarizes some of the current (March 2017) relevant regulations.

Frequency-Hopping, Spread-Spectrum (FHSS) mode, which requires the device transmit at a measured conducted power level no greater than +30 dBm, for a period of no more than 400 msec and over at least 50 channels, each of which occupy no greater than 250 kHz of bandwidth and separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Digital Transmission System (DTS) mode, which requires that the device use channels greater than or equal to 500 kHz and comply to a conducted Power Spectral Density measurement of no more than +8 dBm per 3 kHz of spectrum. In practice, this limits the conducted output power of an end-device to +26 dBm.

Hybrid mode, which requires that the device transmit over multiple channels (this may be less than the 50 channels required for FHSS mode but is recommended to be at least 4) while complying with the Power Spectral Density requirements of DTS mode and the 400 msec dwell time of FHSS mode. In practice this limits the measured conducted power of the end-device to 21 dBm.

RP002-1.0.3 LoRaWAN® Regional Parameters

Devices which use an antenna system with a directional gain greater than +6 dBi but reduce the specified conducted output power by the amount in dB of directional gain over +6 dBi.

US902-928 end-devices SHALL be capable of operating in the 902 to 928 MHz frequency band and SHALL feature a channel data structure to store the parameters for 72 channels. This channel data structure contains a list of frequencies and the set of data rates available for each frequency.

If using the over-the-air activation procedure, the end-device SHALL transmit the Join-Request message on random 125 kHz channels amongst the 64 125 kHz channels defined using **DR0** and on 500 kHz channels amongst the 8 500kHz channels defined using **DR4**. The end-device SHALL change channels for every transmission.

For rapid network acquisition in mixed gateway channel plan environments, the device SHOULD follow a random channel selection sequence which efficiently probes the octet groups of eight 125 kHz channels followed by probing one 500 kHz channel each pass. Each consecutive pass SHOULD NOT select a channel that was used in a previous pass, until a Join-request is transmitted on every channel, after which the entire process can restart.

Example: First pass: Random channel from [0-7], followed by [8-15]... [56-63], then 64 Second pass: Random channel from [0-7], followed by [8-15]... [56-63], then 65

Last pass: Random channel from [0-7], followed by [8-15]... [56-63], then 71

Personalized devices SHALL have all 72 channels enabled following a reset and SHALL use the channels for which the device's default data-rate is valid.

2.5.3 US902-928 Data Rate and End-device Output Power encoding

FCC regulation imposes for frequency hopping systems, a maximum dwell time of 400ms on uplinks, when the 20dB modulation bandwidth is less than 500 kHz. The *TxParamSetupReq* MAC command is not implemented by US902-928 devices.

The following encoding is used for Data Rate (**DR**) and End-device conducted Power (**TXPower**) in the US902-928 band:

Configuration

		physical bit rate [bit/sec]
0	LoRa: SF10 / 125 kHz	980
1	LoRa: SF9 / 125 kHz	1760
2	LoRa: SF8 / 125 kHz	3125
3	LoRa: SF7 / 125 kHz	5470
4	LoRa: SF8 / 500 kHz	12500
5	LR-FHSS CR1/3: 1.523 MHz BW	162
6	LR-FHSS CR2/3: 1.523 MHz BW	325
7	RFU	
8	LoRa: SF12 / 500 kHz	980
9	LoRa: SF11 / 500 kHz	1760
10	LoRa: SF10 / 500 kHz	3900
11	LoRa: SF9 / 500 kHz	7000

615 616

617

618

For LoRaWAN® 1.0.1 and 1.0.2, the US902-928 region does not support the use of the OPTIONAL **CFlist** appended to the Join-Accept message. If the **CFlist** is not empty it is ignored by the end-device.

619 620 621

622

623 624 The US902-928 LoRaWAN® supports the use of the OPTIONAL **CFlist** appended to the Join-Accept message. If the **CFlist** is not empty, then the **CFListType** field SHALL contain the value one (0x01) to indicate the **CFList** contains a series of ChMask fields. The ChMask fields are interpreted as being controlled by a virtual ChMaskCntl that initializes to a value of

2.5.4 US902-928 Join-Accept CFList

_

¹⁷ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

¹⁸ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

 zero (0) and increments for each ChMask field to a value of four (4). (The first 16 bits controls the channels 0 to 15...)

Size	[2]	[2]	[2]	[2]	[2]	[2]	[3]	[1]
(bytes)								
CFList	ChMask0	ChMask1	ChMask2	ChMask3	ChMask4	RFU	RFU	CFListType

2.5.5 US902-928 LinkAdrReq command

For the US902-928 version the **ChMaskCntl** field of the **LinkADRReq** command has the following meaning:

ChMaskCntl	ChMask applies to	
0	Channels 0 to 15	
1	Channels 16 to 31	
2	Channels 32 to 47	
3	Channels 48 to 63	
4	Channels 64 to 71	
5	8LSBs controls Channel Blocks 0 to 7 (8MSBs are RFU)	
6	All 125 kHz ON: ChMask applies to channels 64 to 71	
7	All 125 kHz OFF : ChMask applies to channels 64 to 71	

Table 19: US902-928 ChMaskCntl value table

If **ChMaskCntl** = 5¹⁹ then the corresponding bits in the ChMask enable and disable a bank of 8 125 kHz channels and the corresponding 500 kHz channel defined by the following calculation: [ChannelMaskBit * 8, ChannelMaskBit * 8 +7],64+ChannelMaskBit.

If **ChMaskCntl** = 6 then all 125 kHz channels are enabled, if **ChMaskCntl** = 7 then all 125 kHz channels are disabled. Simultaneously the channels 64 to 71 are set according to the **ChMask** bit mask. The Data Rate specified in the command need not be valid for channels specified in the ChMask, as it governs the global operational state of the end-device.

Note: FCC regulation requires hopping over at least 50 channels when using maximum output power. This is achieved either when more than 50 LoRa/125 kHz channels are enabled and/or when at least one LR-FHSS channel is enabled. It is possible to have end-devices with less channels when limiting the end-device conducted transmit power to 21 dBm.

Note: A common network server action may be to reconfigure a device through multiple LinkAdrReq commands in a contiguous block of MAC Commands. For example, to reconfigure a device from 64 channel operation to the first 8 channels could contain two LinkAdrReq, the first (ChMaskCntl = 7) to disable all 125 kHz channels and the second (ChMaskCntl = 0) to enable a bank of 8 125 kHz channels. Alternatively, using ChMaskCntl = 5 a device can be re-configured from 64 channel operation to support the first 8 channels in a single LinkAdrReq.

_

¹⁹ Added in LoRaWAN® Regional Parameters Specification version 1.0.3rA

2.5.6 US902-928 Maximum payload size

The maximum **MACPayload** size length (M) is given by the following table. It is derived from the maximum allowed transmission time at the PHY layer taking into account a possible repeater encapsulation. The maximum application payload length in the absence of the OPTIONAL **FOpts** MAC control field (N) is also given for information only. The value of N MAY be smaller if the **FOpts** field is not empty:

Data Rate	M	N

The allowed values for RX1DROffset are in the [0:3] range. Values in the range [4:7] are reserved for future use.

2.5.8 US902-928 Class B beacon²¹

The beacons SHALL be transmitted using the following settings:

DR	8	Corresponds to SF12 spreading factor with 500 kHz bw
CR	1	Coding rate = 4/5
Signal polarity	Non-inverted	As opposed to normal downlink traffic which uses inverted
		signal polarity
frequencies	923.3 to 927.5 MHz	Beaconing is performed on the same channel that normal
	with 600 kHz steps	downstream traffic as defined in the Class A specification

Table 23: US902-928 beacon settings

The downstream channel used for a given beacon is:

Channel =
$$\left[floor\left(\frac{beacon_time}{beacon_period}\right)\right]$$
 modulo 8

- whereby beacon_time is the integer value of the 4 bytes "Time" field of the beacon frame
- whereby beacon period is the periodicity of beacons, 128 seconds
- whereby floor(x) designates rounding to the integer immediately inferior or equal to x

Example: the first beacon will be transmitted on 923.3 MHz, the second on 923.9 MHz, the 9th beacon will be on 923.3 MHz again.

Beacon channel number	Frequency [MHz]
0	923.3
1	923.9
2	924.5
3	925.1
4	925.7
5	926.3

²⁰ Re-defined in the LoRaWAN® 1.0.1 specification to eliminate RX1DROffset values beyond DR4

2.6.2 CN779-787 Band Channel Frequencies

CN779-787 devices may not be produced, imported or installed after 2021-01-01; deployed devices may continue to operate through their normal endof-life.

- The LoRaWAN® can be used in the Chinese 779-787 MHz band as long as the radio device EIRP is less than 12 dBm.
- 714 The end-device transmit duty-cycle SHALL be lower than 1%.
- 715 The LoRaWAN® channels center frequency MAY be in the following range:
 - Minimum frequency: 779.5 MHz
 - Maximum frequency: 786.5 MHz

network per network basis.

- CN780 end-devices SHALL be capable of operating in the 779 to 787 MHz frequency band and SHALL feature a channel data structure to store the parameters of at least 16 channels.
- A channel data structure corresponds to a frequency and a set of data rates usable on this frequency.
- The first three channels correspond to 779.5, 779.7 and 779.9 MHz with DR0 to DR5 and SHALL be implemented in every end-device. For devices compliant with TS001-1.0.x, those default channels SHALL NOT be modified through the *NewChannelReq* command. For devices compliant with TS001-1.1.x and beyond, these channels MAY be modified through the *NewChannelReq* but SHALL be reset during the backoff procedure defined in TS001-1.1.1 to guarantee a minimal common channel set between end-devices and gateways of all networks. Other channels can be freely distributed across the allowed frequency range on a
- The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message The Join-Request message transmit duty-cycle SHALL follow the rules described in chapter "Retransmissions back-off" of the LoRaWAN® specification document. Those channels are the minimum set that all network gateways SHALL be listening on.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	779.5 779.7 779.9	DR0 – DR5 / 0.3-5 kbps	3	< 1%

Table 25: CN779-787 Join-Request Channel List

2.6.3 CN779-787 Data Rate and End-device Output Power encoding

There is no dwell time limitation for the CN779-787 PHY layer. The *TxParamSetupReq* MAC command is not implemented by CN779-787 devices.

²³ Defined in the LoRaWAN® 1.0.1 specification

The following encoding is used for Data Rate (DR) and End-device EIRP (TXPower) in the CN779-787 band:

_		
•	71

T)/ (1 1 1	

Table 26: CN779-787 Data rate and TX power table

743744745

746

747

748

CN779-787 end-devices SHALL support one of the 2 following data rate options:

- 1. DR0 to DR5 (minimum set supported for certification)
- 2. DR0 to DR7

For both of the options all data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

749 750 751

752 753 When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

DRcurrent	DRnext	Comment
0	NA	Already the lowest data rate
1	0	
2	1	
3	2	
4	3	
5	4	
6	5	
7	6	

Table 27: CN779-787 Data Rate Backoff table

754 755

756

757

758

762

EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output power referenced to an isotropic antenna radiating power equally in all directions and whose gain is expressed in dBi.

By default, Max EIRP is considered to be +12 dBm. If the end-device cannot achieve 12 dBm EIRP, the Max EIRP SHOULD be communicated to the network server using an out-of-band channel during the end-device commissioning process.

2.6.4 CN779-787 Join-Accept CFList

The CN780 band LoRaWAN® implements an OPTIONAL **channel frequency list** (CFlist) of 16 octets in the Join-Accept message.

 $^{^{24}}$ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

In this case the CFList is a list of five channel frequencies for the channels three to seven whereby each frequency is encoded as a 24 bits unsigned integer (three octets). All these channels are usable for DR0 to DR5 125 kHz LoRa modulation. The list of frequencies is followed by a single CFListType octet for a total of 16 octets. The CFListType SHALL be equal to zero (0) to indicate that the CFList contains a list of frequencies.

Size (bytes)	3	3	3	3	3	1
CFList	Freq Ch3	Freq Ch4	Freq Ch5	Freq Ch6	Freq Ch7	CFListType

 The actual channel frequency in Hz is 100 x frequency whereby values representing frequencies below 100 MHz are reserved for future use. This allows setting the frequency of a channel anywhere between 100 MHz to 1.678 GHz in 100 Hz steps. Unused channels have a frequency value of 0. The **CFList** is OPTIONAL and its presence can be detected by the length of the join-accept message. If present, the **CFList** SHALL replace all the previous channels stored in the end-device apart from the three default channels.

The newly defined channels are immediately enabled and usable by the end-device for communication.

2.6.5 CN779-787 LinkAdrReq command

The CN780 LoRaWAN® only supports a maximum of 16 channels. When **ChMaskCntl** field is 0 the ChMask field individually enables/disables each of the 16 channels.

ChMaskCntl	skCntl ChMask applies to			
0	Channels 0 to 15			
1	RFU			
• •	2			
4	RFU			
5	RFU			
6	All channels ON: The device SHALL enable all currently defined channels			
	independently of the ChMask field value.			
7	RFU			

Table 28: CN779-787 ChMaskCntl value table

If the ChMask field value is one of values meaning RFU, then end-device SHALL²⁵ reject the command and unset the "**Channel mask ACK**" bit in its response.

2.6.6 CN779-787 Maximum payload size

The maximum **MACPayload** size length (M) is given by the following table. It is derived from limitation of the PHY layer depending on the effective modulation rate used taking into account a possible repeater encapsulation layer. The maximum application payload length in the absence of the OPTIONAL **FOpts** control field (N) is also given for information only. The value of N MAY be smaller if the **FOpts** field is not empty:

Data Rate	M	N
0	59	51

2.7 EU433 MHz ISM Band

819 2.7.1 EU433 Preamble Format

820 Please refer to Section 3.0 Physical Layer.

2.7.2 EU433 ISM Band Channel Frequencies

- The LoRaWAN® can be used in the 433.05 to 434.79 MHz ISM band in ITU Region 1 as long as the radio device EIRP is less than 12 dBm.
- The end-device transmit duty-cycle SHALL be lower than 10%.²⁷
- The LoRaWAN® channels center frequency can be in the following range:
 - Minimum frequency: 433.175 MHz
 - Maximum frequency: 434.665 MHz

828 EU433 end-devices SHALL be capable of operating in the 433.05 to 434.79 MHz frequency 829 band and SHALL feature a channel data structure to store the parameters of at least 16 830 channels. A channel data structure corresponds to a frequency and a set of data rates usable 831 on this frequency.

The first three channels correspond to 433.175, 433.375 and 433.575 MHz with DR0 to DR5 and SHALL be implemented in every end-device. For devices compliant with TS001-1.0.x, those default channels SHALL NOT be modified through the *NewChannelReq* command. For devices compliant with TS001-1.1.x and beyond, these channels MAY be modified through the *NewChannelReq* but SHALL be reset during the backoff procedure defined in TS001-1.1.1 to guarantee a minimal common channel set between end-devices and gateways of all networks. Other channels can be freely distributed across the allowed frequency range on a network per network basis.

The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message. The Join-Request message transmit duty-cycle SHALL follow the rules described in chapter "Retransmissions back-off" of the LoRaWAN® specification document.

N	lodulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels	Duty cycle
	LoRa	125	433.175 433.375 433.575	DR0 – DR5 / 0.3-5 kbps	3	< 1%

Table 33: EU433 Join-Request Channel List

2.7.3 EU433 Data Rate and End-device Output Power encoding

There is no dwell time limitation for the EU433 PHY layer. The *TxParamSetupReq* MAC command is not implemented by EU433 devices.

The following encoding is used for Data Rate (DR) and End-device EIRP (TXPower) in the EU433 band:

²⁷ Defined in the LoRaWAN® Regional Parameters 1.0.2 specification

Data Rate	Configuration	Indicative physical bit rate [bit/s]
0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980

868

869

870

871

EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output power referenced to an isotropic antenna radiating power equally in all directions and whose gain is expressed in dBi.

By default, the Max EIRP is considered to be +12 dBm. If the end-device cannot achieve 12 dBm EIRP, the Max EIRP SHALL be communicated to the network server using an out-of-band channel during the end-device commissioning process.

2.7.4 EU433 Join-Accept CFList

872 873 874

The EU433 ISM band LoRaWAN® implements an OPTIONAL **channel frequency list** (CFlist) of 16 octets in the Join-Accept message.

876 877

875

In this case the CFList is a list of five channel frequencies for the channels three to seven whereby each frequency is encoded as a 24 bits unsigned integer (three octets). All these

 $^{^{28}}$ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

channels are usable for DR0 to DR5 125 kHz LoRa modulation. The list of frequencies is followed by a single CFListType octet for a total of 16 octets. The CFListType SHALL be equal to zero (0) to indicate that the CFList contains a list of frequencies.

880	
881	

882

891

878

879

Size (bytes)	3	3	3	3	3	1
CFList	Freq Ch3	Freq Ch4	Freq Ch5	Freq Ch6	Freq Ch7	CFListType

The actual channel frequency in Hz is 100 x frequency whereby values representing frequencies below 100 MHz are reserved for future use. This allows setting the frequency of a channel anywhere between 100 MHz to 1.678 GHz in 100 Hz steps. Unused channels have a frequency value of 0. The **CFList** is OPTIONAL and its presence can be detected by the length of the join-accept message. If present, the **CFList** SHALL replace all the previous channels stored in the end-device apart from the three default channels.

The newly defined channels are immediately enabled and usable by the end-device for communication.

2.7.5 EU433 LinkAdrReq command

The EU433 LoRaWAN® only supports a maximum of 16 channels. When **ChMaskCntl** field is 0 the ChMask field individually enables/disables each of the 16 channels.

892 893

ChMaskCntl	ChMask applies to	
0	Channels 0 to 15	
1	RFU	
4	RFU	
5	RFU	
6	All channels ON: The device SHALL enable all currently defined channels	
	regardless of the ChMask field value.	
7	RFU

896

897

898

899

900

Table 36: EU433 ChMaskCntl value table

If the ChMask field value is one of the values meaning RFU, then end-device SHALL²⁹ reject the command and unset the "**Channel mask ACK**" bit in its response.

2.7.6 EU433 Maximum payload size

The maximum **MACPayload** size length (M) is given by the following table. It is derived from limitation of the PHY layer depending on the effective modulation rate used taking into account a possible repeater encapsulation layer. The maximum application payload length in the absence of the OPTIONAL **FOpts** control field (N) is also given for information only. The value of N might be smaller if the **FOpts** field is not empty:

901
902
903

Data Rate	М	N

913

2.7.7 EU433 Receive windows

By default, the RX1 receive window uses the same channel as the preceding uplink. The data rate is a function of the uplink data rate and the RX1DROffset as given by the following table. The allowed values for RX1DROffset are in the [0:5] range. Values in the range [6:7] are reserved for future use.

914915

2.8 AU915-928 MHz Band³¹

This section defines the regional parameters for Australia and all other countries whose band extends from 915 to 928 MHz spectrum.

2.8.1 AU915-928 Preamble Format

Please refer to Section 3.0 Physical Layer.

2.8.2 AU915-928 Band Channel Frequencies

The AU915-928 Band SHALL be divided into the following channel plans.

- Upstream 64 channels numbered 0 to 63 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 915.2 MHz and incrementing linearly by 200 kHz to 927.8 MHz
- Upstream 8 channels numbered 64 to 71 utilizing LoRa 500 kHz BW at DR6 or LR-FHSS 1.523 MHz BW at DR7 starting at 915.9 MHz and incrementing linearly by 1.6 MHz to 927.1 MHz
- Downstream 8 channels numbered 0 to 7 utilizing LoRa 500 kHz BW at DR8 to DR13) starting at 923.3 MHz and incrementing linearly by 600 kHz to 927.5 MHz

Figure 2: AU915-928 channel frequencies

AU915-928 band end-devices MAY use a maximum EIRP of +30 dBm.

AU915-928 end-devices SHALL be capable of operating in the 915 to 928 MHz frequency band and SHALL feature a channel data structure to store the parameters of 72 channels. A channel data structure corresponds to a frequency and a set of data rates usable on this frequency.

If using the over-the-air activation procedure, the end-device SHALL broadcast the Join-Request message alternatively on a random 125 kHz channel amongst the 64 channels defined using **DR2** and on a 500 kHz channel amongst the 8 channels defined using **DR6**. The end-device SHOULD change channel for every transmission.

For rapid network acquisition in mixed gateway channel plan environments, the device SHOULD follow a random channel selection sequence which efficiently probes the octet groups of eight 125 kHz channels followed by probing one 500 kHz channel each pass.

Each consecutive pass SHOULD NOT select a channel that was used in a previous pass, until a Join-request is transmitted on every channel, after which the entire process can restart.

959 960 961

©2021 LoRa Alliance ®

³¹ Defined in the LoRaWAN® 1.0.1 specification

RP002-1.0.3 LoRaWAN® Regional Parameters

962 Example: First pass: Random channel from [0-7], followed by [8-15]... [56-63], then 64
963 Second pass: Random channel from [0-7], followed by [8-15]... [56-63], then
964 65

Personalized devices SHALL have all 72 channels enabled following a reset and SHALL use

Last pass: Random channel from [0-7], followed by [8-15]... [56-63], then 71

the channels for which the device's default data-rate is valid.

The default Join-Request Data Rate SHALL be DR2 (SF10/125 kHz), this setting ensures that end-devices are compatible with the 400ms dwell time limitation until the actual dwell time limit is notified to the end-device by the network server via the MAC command *TxParamSetupReg*.

AU915-928 end-devices SHALL consider UplinkDwellTime = 1 during boot stage until reception of the *TxParamSetupReq* command.

AU915-928 end-devices SHALL always consider DownlinkDwellTime = 0, since downlink channels use 500 kHz bandwidth without any dwell time limit.

2.8.3 AU915-928 Data Rate and End-point Output Power encoding

The TxParamSetupReq and TxParamSetupAns MAC commands SHALL be implemented by AU915-928 devices.

If the field UplinkDwellTime is set to 1 by the network server in the *TxParamSetupReq* command, AU915-928 end-devices SHALL adjust the time between two consecutive uplink transmissions to meet the local regulation. Twenty seconds (20s) are recommended between 2 uplink transmissions when UplinkDwellTime = 1 but this value MAY be adjusted depending on local regulation.

There is no such constraint on time between two consecutive transmissions when UplinkDwellTime = 0.

The following encoding is used for Data Rate (**DR**) and end-point EIRP (**TXPower**) in the AU915-928 band:

Data Rate	Configuration	Indicative physical bit rate [bit/sec]
0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980
3	LoRa: SF9 / 125 kHz	1760
4	LoRa: SF8 / 125 kHz	3125
5	LoRa: SF7 / 125 kHz	5470
6	LoRa: SF8 / 500 kHz	12500
7	LR-FHSS CR1/3: 1.523 MHz BW	162
8	LoRa: SF12 / 500 kHz	980
9	LoRa: SF11 / 500 kHz	1760
10	LoRa: SF10 / 500 kHz	3900
11	LoRa: SF9 / 500 kHz	7000
12	LoRa: SF8 / 500 kHz	12500

Data Data

In all a attres

13	LoRa: SF7 / 500 kHz	21900
14	RFU	
15	Defined in [TS001] ³²	

Table 41: AU915-928 DataRate table

Note: DR6 is purposely identical to DR12, DR8...13 refer to data rates that are only used for downlink messages.

AU915-928 devices SHALL support one of the 2 following data rate options:

- 1. [DR0 to DR6] and [DR8 to DR13] (minimum set supported for certification)
- 2. [DR0 to DR13] (all data rates implemented)
 In both cases all data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

UplinkDwellTime=0		UplinkDwellTime=1			
DRcurrent	DRnext	DRcurrent	DRnext		
0	NA	NA	NA		
1	0	NA	NA		
2	1	2	NA		
3	2	3	2		
4	3	4	3		
5	4	5	4		
6	5	6	5		
7	0	7	2		
DR 8 to DR1	DR 8 to DR15 are either RFU reserved or only used in downlink				

Table 42: AU915-928 Data Rate Backoff table

TXPower	Configuration (EIRP)		
0	Max EIRP		
1:14	Max EIRP – 2*TXPower		
15	Defined in [TS001] ³²		
Table 43 : AU915-928 TX power table			

EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output power referenced to an isotropic antenna radiating power equally in all directions and whose gain is expressed in dBi.

By default, the Max EIRP is considered to be +30dBm. The Max EIRP can be modified by the network server through the *TxParamSetupReq* MAC command and SHALL be used by both the end-device and the network server once *TxParamSetupReq* is acknowledged by the device via *TxParamSetupAns*.

2.8.4 AU915-928 Join-Accept CFList

The AU915-928 LoRaWAN® supports the use of the OPTIONAL **CFlist** appended to the Join-Accept message. If the **CFlist** is not empty, then the CFListType field SHALL contain

[.]

 $^{^{32}}$ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

the value one (0x01) to indicate the CFList contains a series of ChMask fields. The ChMask fields are interpreted as being controlled by a virtual ChMaskCntl that initializes to a value of zero (0) and increments for each ChMask field to a value of four (4). (The first 16 bits controls the channels 0 to 15...)

Size	[2]	[2]	[2]	[2]	[2]	[2]	[3]	[1]
(bytes)								
CFList	ChMask0	ChMask1	ChMask2	ChMask3	ChMask4	RFU	RFU	CFListType

2.8.5 AU915-928 LinkAdrReg command

For the AU915-928 version the **ChMaskCntl** field of the **LinkADRReq** command has the following meaning:

ChMaskCntl	ChMask applies to
0	Channels 0 to 15
1	Channels 16 to 31
• •	:
4	Channels 64 to 71
5	8LSBs control Channel Blocks 0 to 7 (8MSBs are RFU)
6	All 125 kHz ON: ChMask applies to channels 64 to 71
7	All 125 kHz OFF: ChMask applies to channels 64 to 71

Table 44: AU915-928 ChMaskCntl value table

If **ChMaskCntl** = 5³³ then the corresponding bits in the ChMask enable and disable a bank of 8 125 kHz channels and the corresponding 500 kHz channel defined by the following calculation: [ChannelMaskBit * 8, ChannelMaskBit * 8 +7],64+ChannelMaskBit.

If **ChMaskCntl** = 6 then 125 kHz channels are enabled, if **ChMaskCntl** = 7 then 125 kHz channels are disabled. Simultaneously the channels 64 to 71 are set according to the **ChMask** bit mask. The Data Rate specified in the command need not be valid for channels specified in the ChMask, as it governs the global operational state of the end-device.

2.8.6 AU915-928 Maximum payload size

The maximum **MACPayload** size length (M) is given by the following table for both uplink dwell time configurations: No Limit and 400ms. It is derived from the maximum allowed transmission time at the PHY layer taking into account a possible repeater encapsulation. The maximum application payload length in the absence of the OPTIONAL **FOpts** MAC control field (N) is also given for information only. The value of N might be smaller if the **FOpts** field is not empty:

Data Rate	UplinkDwellTime=0		UplinkDv	vellTime=1
	М	N	М	N
0	59	51	N/A	N/A
1	59	51	N/A	N/A
2	59	51	19	11
3	123	115	61	53
4	230	222	133	125
5	230	222	230	222
6	230	222	230	222
7	58	50	58	50

³³ Added in LoRaWAN® Regional Parameters Specification version 1.0.3rA

8	61	53	61	53

10	230	222	230	222
11	230	222	230	222
12	230	222	230	222
13	230	222	230	222
14:15	Not defined		Not c	lefined

Table 45: AU915-928 maximum payload size (repeater compatible)

For AU915-928, **DownlinkDwellTime** SHALL be set to 0 (no limit). The 400ms dwell time MAY apply to uplink channels depending on the local regulations.

If the end-device will never operate with a repeater then the maximum application payload length in the absence of the OPTIONAL **FOpts** control field SHALL be:

Data Rate	UplinkDwe	IITime=0	UplinkDv	vellTime=1
	M	N	M	N
0	59	51	N/A	N/A
1	59	51	N/A	N/A

1071

The allowed values for RX1DROffset are in the [0:5] range. Values in the range [6:7] are reserved for future use.

2.8.8 AU915-928 Class B beacon

The beacons are transmitted using the following settings:

DR	8	Corresponds to SF12 spreading factor with 500 kHz bw
CR	1	Coding rate = 4/5
Signal polarity	Non-inverted	As opposed to normal downlink traffic which uses
		inverted signal polarity
frequencies	923.3 to 927.5MHz	Beaconing is performed on the same channel that
	with 600 kHz steps	normal downstream traffic as defined in the Class A
		specification

Table 48: AU915-928 beacon settings

10721073

The downstream channel used for a given beacon is:

1074

1075 Channel =
$$\left[floor\left(\frac{beacon_time}{beacon_period}\right)\right]$$
 modulo 8

1076

1077
• whereby beacon_time is the integer value of the 4 bytes "Time" field of the beacon frame

1078 1079 1080

whereby beacon_period is the periodicity of beacons, 128 seconds
whereby floor(x) designates rounding to the integer immediately inferior or equal to x

1081 1082 1083 Example: the first beacon will be transmitted on 923.3 MHz, the second on 923.9 MHz, the 9th beacon will be on 923.3 MHz again.

Beacon channel nb	Frequency [MHz]
0	923.3
1	923.9
2	924.5
3	925.1
4	925.7
5	926.3

926.9

1084 1085

The beacon frame content is defined in [TS001].34

1086 The default Class B PING_SLOT_CHANNEL is defined in the LoRaWAN® specification.

1087 2.8.9 AU915-928 Default Settings

1088 There are no specific default settings for AU 915-928 MHz Band.

³⁴ Prior to LoRaWAN® 1.0.4, the beacon was defined here as:

Size (bytes)	3	4	2	7	1	2
BCNPayload	RFU	Time	CRC	GwSpecific	RFU	CRC

2.9 CN470-510 MHz Band³⁵

Note: The CN470-510 channel plan has been significantly changed from prior revisions and should be considered experimental pending published documents confirming plan compliant devices have been granted local regulatory approval.

2.9.1 CN470-510 Preamble Format

Please refer to Section 3.0 Physical Layer.

2.9.2 CN470-510 Band Channel Frequencies

In China, this band is defined by SRRC to be used for small scale networks covering civil metering applications in buildings, residential areas and villages. The transmission time shall not exceed one second and is limited to one channel at a time. For interferences mitigation, access to the physical medium requires a Listen Before Talk Adaptive Frequency Agility (LBT AFA) transmission management or other similar mechanisms like channels blacklisting.

Note: The limitation of scope to small scale networks enters into effect after November 2021. Gateways and end-devices deployed prior to December 1, 2021 are not required to comply with this restriction.

In the areas where channels are used by China Broadcasting Services, they SHALL be disabled.

For the CN470-510 MHz band, the bandwidth is the biggest and the frequency is the lowest compared to all the countries and areas in this document. The bandwidth and the frequency affect the design of antennas. There are several different antenna solutions for CN470-510 MHz band.

The CN470-510 MHz SRD Band shall be divided into the channel plans as follows:

- The channel plan for 20 MHz antenna (type A and B)
- The channel plan for 26 MHz antenna (type A and B)

20 common join channels are defined for all the channel plans mentioned above.

Common Join Channel Index	UL (MHz)	DL (MHz)	Activate 20 MHz	Activate 20 MHz	Activate 26 MHz	Activate 26 MHz
index	(IVITZ)	(IVITZ)	plan A	plan B	plan A	plan B
0	470.9	484.5	Х

1155

All the above channel plans SHALL be implemented in the CN470 end-devices.

End devices SHALL scan all the common join channels. If the end-device receives the join-accept message from one of the above DL common join channel, the end-device SHALL use the corresponding channel plan³⁶ in the above table.

2.9.2.1 Channel Plan for 20 MHz Antenna

For 20 MHz Antennas, the CN470-510 MHz Band shall be divided into two channel plans: plan Type A and plan Type B.

For channel plan Type A:

- Upstream (Group 1) 32 channels numbered 0 to 31 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 470.3 MHz and incrementing linearly by 200 kHz to 476.5 MHz
- Downstream (Group 1) 32 channels numbered 0 to 31 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 483.9 MHz and incrementing linearly by 200 kHz to 490.1 MHz
- Downstream (Group 2) 32 channels numbered 32 to 63 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 490.3 MHz and incrementing linearly by 200 kHz to 496.5 MHz
- Upstream (Group 2) 32 channels numbered 32 to 63 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 503.5 MHz and incrementing linearly by 200 kHz to 509.7 MHz

Table 50: channel plan type A for 20MHz antenna channel frequencies

1147 For channel plan Type B:

Upstream (Group 1) – 32 channels numbered 0 to 31 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 476.9 MHz and incrementing linearly by 200 kHz to 483.1 MHz.

- Downstream (Group 1) 32 channels numbered 0 to 31 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 476.9 MHz and incrementing linearly by 200 kHz to 483.1 MHz.
- Upstream (Group 2) 32 channels numbered 32 to 63 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 496.9 MHz and

©2021 LoRa Alliance ®

³⁶ The corresponding channel plan can be determined by the uplink join channel, which corresponds to a pair of common join channels including UL and DL. The DL join channel is the channel from which the end-device receives the join-accept message.

incrementing linearly by 200 kHz to 503.1 MHz.

Downstream (Group 2) – 32 channels numbered 32 to 63 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 496.9 MHz and incrementing linearly by 200 kHz to 503.1 MHz.

Table 51

Table 51: channel plan type B for 20MHz antenna channel frequencies

2.9.2.2 Channel Plan for 26 MHz antenna

For 26 MHz Antennas, the CN470-510 MHz Band shall be divided into two channel plans: plan Type A and plan Type B.

For channel plan Type A:

- Upstream 48 channels numbered 0 to 47 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 470.3 MHz and incrementing linearly by 200 kHz to 479.7 MHz
- Downstream 24 channels numbered 0 to 23 utilizing LoRa 125 kHz BW at DR0 to DR5, starting at 490.1 MHz and incrementing linearly by 200 kHz to 494.7 MHz. Additional frequencies from 494.9 to 495.9 MHz are available for configurable downlink parameters (beacon frequency, ping-slot frequency and RX2 frequency).

Table 52: channel plan type A for 26MHz antenna channel frequencies

For channel plan Type B:

- Upstream 48 channels numbered 0 to 47 utilizing LoRa 125 kHz BW varying from DR0 to DR5, using coding rate 4/5, starting at 480.3 MHz and incrementing linearly by 200 kHz to 489.7 MHz
- Downstream 24 channels numbered 0 to 23 utilizing LoRa 125 kHz BW at DR0 to DR5, starting at 500.1 MHz and incrementing linearly by 200 kHz to 504.7 MHz. Additional frequencies from 504.9 to 505.9 MHz are available for configurable downlink parameters (beacon frequency, ping-slot frequency and RX2 frequency).

Table 53: channel plan type B for 26MHz antenna channel frequencies

1186 If using the over-the-air activation procedure, the end-device SHALL broadcast the Join-1187 Request message on a random 125 kHz channel amongst the 20 uplink channels defined previously in this section using DR5 to DR0. 1188

1189 Personalized devices SHALL have all channels enabled corresponding to activation plan 1190 following a reset.

2.9.3 CN470-510 Data Rate and End-point Output Power encoding

The *TxParamSetupReq* MAC command is not implemented by CN470-510 devices.

The following encoding is used for Data Rate (DR) and end-point EIRP (TXPower) in the CN470-510 band:

Data Rate	Configuration	Indicative physical bit rate [bit/sec]
037	LoRa: SF12/ 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980
3	LoRa: SF9 / 125 kHz	1760
4	LoRa: SF8 / 125 kHz	3125
5	LoRa:SF7 / 125 kHz	5470
6	LoRa:SF7 / 500 kHz	21900
7	FSK: 50 Kbps	50000
8:14	RFU	
15	Defined in [TS001] ³⁸	

TXPower	Configuration (EIRP)
0	Max EIRP
1	Max EIRP – 2dB
2	Max EIRP – 4dB
3	Max EIRP – 6dB
4	Max EIRP – 8dB
5	Max EIRP – 10dB
6	Max EIRP – 12dB
7	Max EIRP – 14dB
814	RFU
15	Defined in [TS001] ³⁸

Table 54: CN470-510 Data rate and TX power table

CN470-510 end-devices SHALL support one of the 2 following data rate options:

- 1. DR0 to DR5 (minimum set supported for certification)
- 2. DR0 to DR7

For both of the options all data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

DRcurrent	DRnext	Comment
0	NA	Already the lowest data rate
1	0	
2	1	
3	2	
4	3	
5	4	
6	5	
7	6	

Table 55: CN470-510 Data Rate Backoff table

1196

1197 1198

1199 1200

1201

1202

1203 1204 1205

1206

³⁷ As of RP002-1.0.1, DR0 is unavailable for devices implementing CN470-510, but remains defined to better support existing implementations.

³⁸ DR15 and TXPower15 are defined in the LinkADRReg MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

1208

1209 EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output 1210 power referenced to an isotropic antenna radiating power equally in all directions and whose

1211 gain is expressed in dBi.

By default, the Max EIRP is considered to be +19 dBm. If the end-device cannot achieve 19 1212 1213 dBm EIRP, the Max EIRP SHOULD be communicated to the network server using an out-of-

1214 band channel during the end-device commissioning process.

2.9.4 CN470-510 Join-Accept CFList

1215 1216 1217

1218

1219 1220

1221

The CN470 LoRaWAN® supports the use of the OPTIONAL CFlist appended to the Join-Accept message. If the CFlist is not empty, then the CFListType field SHALL contain the value one (0x01) to indicate the CFList contains a series of ChMask fields. The ChMask fields are interpreted as being controlled by a virtual ChMaskCntl that initializes to a value of zero (0) and increments for each ChMask field to a value of four (3) for 20 MHz plans A or B and three (2) for 26 MHz plans A or B. (The first 16 bits controls the channels 0 to 15...)

1222 1223 1224

For 20 MHz Antenna Systems:

Size (bytes)	[2]	[2]	[2]	[2]	[2]	[2]	[3]	[1]
CFList	ChMask0	ChMask1	ChMask2	ChMask3	RFU	RFU	RFU	CFListType

1225 1226

For 26 MHz Antenna Systems:

1227

Size	[2]	[2]	[2]	[2]	[2]	[2]	[3]	[1]
(bytes)	[2]	[2]	[2]	[2]	[2]	[2]	[၁]	נין
CFList	ChMask0	ChMask1	ChMask2	RFU	RFU	RFU	RFU	CFListType

1228

1229

2.9.5 CN470-510 LinkAdrReq command

2.9.5.1 Channel Plan for 20 MHz antenna

1230 1231 1232

1233

For 20 MHz antenna the **ChMaskCntl** field of the *LinkADRReq* command has the following meaning:

ChMaskCntl	ChMask applies to
0	Channels 0 to 15
1	Channels 16 to 31
2	Channels 32 to 47
3	Channels 48 to 63
4	RFU
5	RFU
6	All Channels Enabled
7	All Channels Disabled ³⁹

1234

Table 56:CH470 ChMaskCntl value table for 20M Antenna

³⁹ This command must be followed by another LinkADRReq command enabling at least one channel.

1237

If the ChMask field value is one of the values indicating RFU, then end-device SHALL reject the command and unset the "Channel mask ACK" bit in its response.

1238 1239

1240

2.9.5.2 Channel Plan for 26 MHz antenna

The **ChMaskCntl** field of the **LinkADRReq** command has the following meaning:

1241

ChMaskCntl ChMask applies to		
0	Channels 0 to 15	
1	Channels 16 to 31	
2	Channels 32 to 47	
3	All channels Enabled	
4	All channels Disabled ⁴⁰	
5	RFU	
6	RFU	
7	RFU	

1242 1243

Table 57: CH470 ChMaskCntl value table for 26M Antenna

1244 1245

If the ChMask field value is one of the values indicating RFU, the end-device SHALL reject the command and unset the "Channel mask ACK" bit in its response.

1246

2.9.6 CN470-510 Maximum payload size

1247 1248 1249

1250

The maximum **MACPayload** size length (*M*) is given by the following table. It is derived from the maximum allowed transmission time at the PHY layer taking into account a possible repeater encapsulation. The maximum application payload length in the absence of the OPTIONAL **FOpts** MAC control field (N) is also given for information only. The value of N might be smaller if the **FOpts** field is not empty:

1251 1252

Data Rate	M	N	
0 ³⁷	N/A	N/A	
1	31	23	
2	94	86	
3	192	184	
4	230	222	
5	230	222	
6	230	222	
7	230	222	
8:15	Not defined		

1253 1254 Table 58: CN470-510 maximum payload size (repeater compatible)

1255 1256 If the end-device will never operate with a repeater then the maximum application payload length in the absence of the OPTIONAL **FOpts** control field SHALL be:

Data Rate	IVI	N
0^{37}	N/A	N/A
1	31	23
2	94	86
3	192	184

⁴⁰ This command must be followed by another LinkADRReg command enabling at least one channel

1259 1260

2.9.7 CN470-510 Receive windows

The RX1 data rate depends on the transmit data rate (see Table 60 below). The RX2 default data rate is DR1.

1261 1262

Upstream data rate	Downstream data rate					
RX1DROffset	0	1	2	3	4	5
DR0 ³⁷	DR0	DR0	DR0	DR0	DR0	DR0
DR1	DR1	DR1	DR1	DR1	DR1	DR1
DR2	DR2	DR1	DR1	DR1	DR1	DR1
DR3	DR3	DR2	DR1	DR1	DR1	DR1
DR4	DR4	DR3	DR2	DR1	DR1	DR1
DR5	DR5	DR4	DR3	DR2	DR1	DR1
DR6	DR6	DR5	DR4	DR3	DR2	DR1
DR7	DR7	DR6	DR5	DR4	DR3	DR2

1263 1264 Table 60: CN470-510 downlink RX1 data rate mapping

1265

1266

The allowed values for RX1DROffset are in the [0:5] range. Values in the range [6:7] are reserved for future use.

1267

2.9.7.1 Channel Plan for 20 MHz Antenna Systems

1268 1269

For channel plan Type A:

- 1270
- The RX1 downlink channel is the same as the uplink channel number
- 1271
- The RX2 channel number for OTAA devices is defined in Table 61
- 1272
- The RX2 channel number for ABP devices is 486.9 MHz

Common Join Channel Index used in OTAA	RX2 Default Frequency
0	485.3 MHz
1	486.9 MHz
2	488.5 MHz
3	490.1 MHz
4	491.7 MHz
5	493.3 MHz
6	494.9 MHz
7	496.5 MHz

1273

Table 61: RX2 Default Frequency for channel plan type A for 20 MHz antenna

1274

For channel plan Type B:

1275 1276 1277

- The RX1 downlink channel is the same as the uplink channel number 0 The RX2 channel number for OTAA devices is defined in Table 62 0
- The RX2 channel number for ABP devices is 498.3 MHz

Common Join Channel	RX2 Default
Index used in OTAA	Frequency
8	478.3 MHz

498.3 MHz Table 62: RX2 Default Frequency for channel plan type B for 20 MHz antenna

2.9.7.2 Channel Plan for 26 MHz Antenna Systems

- For both plans, the RX1 receive channel is a function of the upstream channel used to initiate the data exchange. The RX1 receive channel can be determined as follows.
 - o RX1 Channel Number = Transmit Channel Number modulo 24
- The RX2 default frequency is:

o For Channel plan A: 492.5 MHz o For Channel plan B: 502.5 MHz

2.9.8 CN470-510 Class B beacon

1289 The beacon frame content is defined in [TS001].41 1290

The beacons are transmitted using the following settings:

DR	2	Corresponds to SF10 spreading factor with 125 kHz bw
CR	1	Coding rate = 4/5
Signal polarity	Non-inverted	As opposed to normal downlink traffic which uses
		inverted signal polarity
frequencies	Defined per plan below	

Table 63: CN470-510 beacon settings

2.9.8.1 Default Beacon and Ping-Slot Channel Numbers and Ping-Slots for 20 MHz **Antenna Systems**

By default, for channel plan Type A:

The downstream channel used for beacon is as the following table according to the common join channel the end-device used:

Common Join Channel Index	Beacon Channel Number
0	$\left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo \ 8$
1	$8 + \left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo 8$
2	16 + $\left[floor\left(\frac{beacon_time}{beacon_period}\right)\right]$ modulo 8
3	$24 + \left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo 8$
4	$32 + \left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo 8$
5	$40 + \left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo 8$
6	$48 + \left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo 8$
7	$56 + \left[floor\left(\frac{beacon_time}{beacon_period}\right)\right] modulo 8$

Table 64: Beacon Channel Number for channel plan type A for 20 MHz antenna

⁴¹ Prior to LoRaWAN® 1.0.4, the beacon was defined here as:

2.10 AS923 MHz Band

1336

1339

1360

1361 1362

1363 1364

1365

1366

1367

1337 **2.10.1 AS923 Preamble Format**

1338 Please refer to Section 3.0 Physical Layer.

2.10.2 AS923 Band Channel Frequencies

- This section was originally intended to apply to regions where the frequencies [915...928 MHz] are present in an unlicensed LPWAN band but MAY also apply to regions with available bands in frequencies up to 1.67 GHz.
- 1342 III frequencies up to 1.67 GHz.
- In order to accommodate country specific sub-bands across 915 928 MHz band, a frequency offset parameter **AS923_FREQ_OFFSET** is defined. **AS923_FREQ_OFFSET** is a 32-bit signed integer, allowing both positive and negative frequency offsets.
- 1346 The corresponding frequency offset in Hz is:

1347 **AS923_FREQ_OFFSET_HZ** = 100 x **AS923_FREQ_OFFSET**.

- AS923_FREQ_OFFSET only applies to end-device default settings. AS923_FREQ_OFFSET does not apply any frequencies delivered to end-device from network server through MAC commands or the CFList.
- AS923 end-devices operated in Japan SHALL perform Listen Before Talk (LBT) based on ARIB STD-T108 regulations. The ARIB STD-T108 regulation is available for free and should be consulted as needed by the user.
- The end-device's LBT requirement, maximum transmission time, duty cycle or other parameters MAY be dependent on frequency of each transmission.
- The network channels can be freely assigned by the network operator. However, the two following default channels SHALL be implemented in every AS923 end-device. Those channels are the minimum set that all network gateways SHALL always be listening on.

Modulation Bandwidth [kHz]		Channel Frequency [Hz]	LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	923200000 + AS923_FREQ_OFFSET_HZ 923400000 + AS923_FREQ_OFFSET_HZ	DR0 to DR5 / 0.3-5 kbps	2	< 1%

Table 68: AS923 default channels

For devices compliant with TS001-1.0.x, those default channels SHALL NOT be modified through the *NewChannelReq* command. For devices compliant with TS001-1.1.x and beyond, these channels MAY be modified through the *NewChannelReq* but SHALL be reset during the backoff procedure defined in TS001-1.1.1 to guarantee a minimal common channel set between end-devices and network gateways.

- AS923 end-devices SHOULD use the following default parameters
 - Default EIRP: 16 dBm
- AS923 end-devices SHALL feature a channel data structure to store the parameters of at least 1369 16 channels. A channel data structure corresponds to a frequency and a set of data rates 1370 usable on this frequency.
- The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message.

Modulation	Bandwidth [kHz]	Channel Frequency [Hz]	LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	923200000 + AS923_FREQ_OFFSET_HZ 923400000 + AS923_FREQ_OFFSET_HZ	DR2 to DR5 / 0.9-5 kbps	2	< 1%

Table 69: AS923 Join-Request Channel List

1373 1374 1375

1376 1377 The default Join-Request Data Rate utilizes the range DR2-DR5 (SF10/125 kHz – SF7/125 kHz), this setting ensures that end-devices are compatible with the 400ms dwell time limitation until the actual dwell time limit is notified to the end-device by the network server via the MAC command TxParamSetupReq.

1378 1379 1380

The Join-Request message transmit duty-cycle SHALL follow the rules described in chapter "Retransmissions back-off" of the LoRaWAN® specification document.

1381 1382

1383

2.10.3 AS923 Data Rate and End-point Output Power encoding

The "TxParamSetupReg/Ans" MAC command SHALL be implemented by the AS923 devices.

The following encoding is used for Data Rate (DR) in the AS923 band:

1384 1385

Data Rate	Configuration	Indicative physical bit rate [bit/s]
0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980
3	LoRa: SF9 / 125 kHz	1760
4	LoRa: SF8 / 125 kHz	3125
5	LoRa: SF7 / 125 kHz	5470
6	LoRa: SF7 / 250 kHz	11000
7	FSK: 50 kbps	50000
814	RFU	
15	Defined in [TS001] ⁴²	

1386 1387

Table 70: AS923 Data rate table

1388 1389

1390

1391 1392 AS923 end-devices SHALL support one of the 2 following data rate options:

- 1. DR0 to DR5 (minimum set supported for certification) 2. DR0 to DR7

For both of the options all data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

1393 1394 1395

1396

When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

	UplinkDwe	IITime=0	UplinkDwellTime=1	
DRcurrent DRnext		DRcurrent	DRnext	
	0	NA	NA	NA
	1	0	NA	NA

⁴² DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN® 1.0.4 and subsequent specifications and were previously RFU

2	1	2	NA
3	2	3	2
4	3	4	3
5	4	5	4
6	5	6	5
7	6	7	6

Table 71: AS923 Data Rate Backoff table

The TXPower table indicates power levels relative to the Max EIRP level of the end-device, as per the following table:

TXPower	Configuration (EIRP)
0	Max EIRP
1	Max EIRP – 2dB
2	Max EIRP – 4dB
3	Max EIRP – 6dB
4	Max EIRP – 8dB
5	Max EIRP – 10dB
6	Max EIRP – 12dB
7	Max EIRP – 14dB
814	RFU
15	Defined in [TS001] ⁴²

Table 72: AS923 TXPower table

EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output power referenced to an isotropic antenna radiating power equally in all directions and whose gain is expressed in dBi.

 By default, the Max EIRP SHALL be 16 dBm. The Max EIRP can be modified by the network server through the *TxParamSetupReq* MAC command and SHOULD be used by both the end-device and the network server once *TxParamSetupReq* is acknowledged by the device via *TxParamSetupAns*,

2.10.4 AS923 Join-Accept CFList

The AS923 LoRaWAN® implements an OPTIONAL channel frequency list (CFlist) of 16 octets in the Join-Accept message.

 In this case the CFList is a list of five channel frequencies for the channels two to six whereby each frequency is encoded as a 24 bits unsigned integer (three octets). All these channels are usable for DR0 to DR5 125 KHz LoRa modulation subject to local regulatory dwell-time limitations. The list of frequencies is followed by a single CFListType octet for a total of 16 octets. The CFListType SHALL be equal to zero (0) to indicate that the CFList contains a list of frequencies.

Size (bytes)	3	3	3	3	3	1
CFList	Freq Ch2	Freq Ch3	Freq Ch4	Freq Ch5	Freq Ch6	CFListType

The actual channel frequency in Hz is 100 x frequency whereby values representing frequencies below 100 MHz are reserved for future use. This allows setting the frequency of

1430

1442 1443

1444

1445

1446

a channel anywhere between 100 MHz and 1.678 GHz in 100 Hz steps. Unused channels have a frequency value of 0. The CFList is OPTIONAL and its presence can be detected by the length of the join-accept message. If present, the CFList replaces all the previous channels stored in the end-device apart from the two default channels. The newly defined channels are immediately enabled and usable by the end-device for communication.

AS923_FREQ_OFFSET does not apply any frequencies delivered to end-device from network server through MAC commands or the CFList. Therefore, AS923 end-devices SHALL NOT apply AS923_FREQ_OFFSET to the channel frequencies defined in the CFList

2.10.5 AS923 LinkAdrReq command

The AS923 LoRaWAN® only supports a maximum of 16 channels. When **ChMaskCntl** field is 0 the ChMask field individually enables/disables each of the 16 channels.

ChMaskCntl	ChMask applies to
0	Channels 0 to 15
1	RFU
2	RFU
3	RFU
4	RFU
5	RFU
6 All channels ON - The device SHOULD enable all currently de	
	channels independently of the ChMask field value.
7	RFU

Table 73: AS923 ChMaskCntl value table

If the ChMask field value is one of values meaning RFU, the end-device SHALL reject the command and unset the "Channel mask ACK" bit in its response.

2.10.6 AS923 Maximum payload size

The maximum **MACPayload** size length (*M*) is given by the following table for both *UplinkDwellTime* and *DownlinkDwellTime* configurations: No Limit and 400ms. It is derived from the maximum allowed transmission time at the PHY layer taking into account a possible repeater encapsulation layer. The maximum application payload length in the absence of the OPTIONAL **FOpts** MAC control field (*N*) is also given for information only. The value of *N* might be smaller if the **FOpts** field is not empty:

Data Rate	DwellTime=0 (No limit)			ime=1 s limit)
	M	N	M	N
0	59	51	N/A	N/A
1	59	51	N/A	N/A
2	123	115	19	11
3	123	115	61	53
4	230	222	133	125
5	230	222	230	222
6	230	222	230	222
7	230	222	230	222
8:15	Not defined		Not d	efined

Table 74: AS923 maximum payload size (repeater compatible)

If the end-device will never operate with a repeater then the maximum application payload length in the absence of the OPTIONAL **FOpts** control field SHALL be:

1449 1450

1451 1452

1453

1454

1455 1456

1457

1448

Data Rate		Time=0 limit)		Time=1 is limit)
	М	N	M	N
0	59	51	N/A	N/A
1	59	51	N/A	N/A
2	123	115	19	11
3	123	115	61	53
4	250	242	133	125
5	250	242	250	242
6	250	242	250	242
7	250	242	250	242
8:15	Not d	efined	Not d	efined

Table 75: AS923 maximum payload size (not repeater compatible)

The end-device SHALL only enforce the maximum Downlink MAC Payload Size defined for DownlinkDwellTime = 0 (no dwell time enforced) regardless of the actual setting. This prevents the end-device from discarding valid downlink messages which comply with the regulatory requirements which may be unknown to the device (for example, when the device is joining the network).

2.10.7 AS923 Receive windows

By default, the RX1 receive window uses the same channel as the preceding uplink. The data rate is a function of the uplink data rate and the RX1DROffset as given by the following table.

The allowed values for RX1DROffset are in the [0:7] range.

Values in the [6:7] range allow setting the Downstream RX1 data rate higher than upstream data rate 43.

When **DownlinkDwellTime** is zero, the allowed values for RX1DROffset are in the [0:7] range, encoded as per the below table.

1465

1463

1464

Upstream data rate			Dow	nstrea	m data	rate		
RX1DROffset	0	1	2	3	4	5	6	7

Table 77: AS923 downlink RX1 data rate mapping for DownLinkDwellTime =1

1472 The RX2 receive window uses a fixed frequency and data rate. The default parameters are 1473 923.2 MHz + AS923 FREQ OFFSET HZ / DR2 (SF10/125 kHz).

2.10.8 AS923 Class B beacon and default downlink channel

1475 The beacons SHALL be transmitted using the following settings

DR	3	Corresponds to SF9 spreading factor with 125 kHz BW
CR	1	Coding rate = 4/5
Signal polarity	Non-inverted	As opposed to normal downlink traffic which uses inverted
		signal polarity

Table 78: AS923 beacon settings

1477 The beacon frame content is defined in [TS001].44

1478 The beacon default broadcast frequency is 923.4 MHz + AS923 FREQ OFFSET HZ.

1479 The class B default downlink pingSlot frequency is 923.4 MHz + AS923 FREQ OFFSET HZ.

1480 2.10.9 AS923 Default Settings

Several default values of AS923 FREQ OFFSET are defined to address all the different 1481 1482 AS923 countries. The default values of AS923 FREQ OFFSET are chosen to minimize their 1483 total number and cover a large number of countries. Four different groups are defined below according to AS923 FREQ OFFSET default value. 1484

1485 Group AS923-1: AS923 FREQ OFFSET default value = 0x00000000,

1486 AS923 FREQ OFFSET HZ = 0.0 MHz

> This group is composed of countries having available frequencies in the 915 - 928 MHz range with common channels in the 923.0 – 923.5 MHz sub-band. These are the "historical" AS923 countries, compliant to RP2-1.0.0 specification and previous versions.

Group AS923-2: AS923 FREQ OFFSET default value = 0xFFFFB9B0, 1492 AS923 FREQ OFFSET HZ = -1.80 MHz

This group is composed of countries having available frequencies in the 920 - 923 MHz range with common channels in the 921.4 – 922.0 MHz sub-band.

⁴⁴ Prior to LoRaWAN® 1.0.4, the beacon was defined here as:

Size (bytes)	2	4	2	7	2
BCNPayload	RFU	Time	CRC	GwSpecific	CRC

©2021 LoRa Alliance ®

1495 1496	Group AS923-3: AS923_FREQ_OFFSET default value = 0xFFFEFE30, AS923_FREQ_OFFSET_HZ = -6.60 MHz
1497 1498	This group is composed of countries having available frequencies in the 915 $-$ 921 MHz range with common channels in the 916.5 $-$ 917.0 MHz sub-band.
1499 1500	Group AS923-4: AS923_FREQ_OFFSET default value = 0xFFFF1988, AS923_FREQ_OFFSET_HZ = -5.90 MHz
1501 1502	This group is composed of countries having available frequencies in the 917 $-$ 920 MHz range with common channels in the 917.3 $-$ 917.5 MHz sub-band.
1503	
1504	There are no other specific default settings for the AS923 Band.

2.11 KR920-923 MHz Band

2.11.1 KR920-923 Preamble Format

Please refer to Section 3.0 Physical Layer.

2.11.2 KR920-923 Band Channel Frequencies

The center frequency, bandwidth and maximum EIRP output power for the South Korea RFID/USN frequency band are defined by Korean Government, which has allocated LPWA based IoT networks the channel center frequencies from 920.9 to 923.3 MHz.

0	D	Maximum EIRP output power (dBm)		
Center frequency (MHz)	Bandwidth (kHz)	For end-device	For gateway	
920.9	125	10	23	
921.1	125	10	23	
921.3	125	10	23	
921.5	125	10	23	
921.7	125	10	23	
921.9	125	10	23	
922.1	125	14	23	
922.3	125	14	23	
922.5	125	14	23	
922.7	125	14	23	
922.9	125	14	23	
923.1	125	14	23	
923.3	125	14	23	

Table 79: KR920-923 Center frequency, bandwidth, maximum EIRP output power table

The three default channels correspond to 922.1, 922.3 and 922.5 MHz / DR0 to DR5 and SHALL be implemented in every KR920-923 end-device. For devices compliant with TS001-1.0.x, those default channels SHALL NOT be modified through the *NewChannelReq* command. For devices compliant with TS001-1.1.x and beyond, these channels MAY be modified through the *NewChannelReq* but SHALL be reset during the backoff procedure defined in TS001-1.1.1 to guarantee a minimal common channel set between end-devices and network gateways.

The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message. The Join-Request message transmit duty-cycle SHALL follow the rules described in chapter "Retransmissions back-off" of the LoRaWAN® specification document.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels
LoRa	125	922.10 922.30 922.50	DR0 to DR5 / 0.3-5 kbps	3

Table 80: KR920-923 default channels

In order to access the physical medium, the South Korea regulations impose several restrictions. The South Korea regulations allow the choice of using either a duty-cycle limitation or Listen Before Talk Adaptive Frequency Agility (LBT AFA) transmission management. The current LoRaWAN® specification for the KR920-923 band exclusively uses

1535 1536

1558 1559

RP002-1.0.3 LoRaWAN® Regional Parameters

- LBT channel access rule to maximize MACPayload size length and comply with the South Korea regulations.
- 1533 KR920-923 MHz band end-devices SHALL use the following default parameters
 - Default EIRP output power for end-device(920.9~921.9 MHz): 10 dBm
 - Default EIRP output power for end-device(922.1~923.3 MHz): 14 dBm
 - Default EIRP output power for gateway: 23 dBm

KR920-923 MHz end-devices SHALL be capable of operating in the 920 to 923 MHz frequency band and SHALL feature a channel data structure to store the parameters of at least 16 channels. A channel data structure corresponds to a frequency and a set of data rates usable on this frequency.

The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels
LoRa	125	922.10 922.30 922.50	DR0 to DR5 / 0.3-5 kbps	3

Table 81: KR920-923 Join-Request Channel List

2.11.3 KR920-923 Data Rate and End-device Output Power encoding

There is no dwell time limitation for the KR920-923 PHY layer. The *TxParamSetupReq* MAC command is not implemented by KR920-923 devices.

The following encoding is used for Data Rate (DR), and EIRP Output Power (TXPower) in the KR920-923 band:

Data Rate	Configuration	Indicative physical bit rate [bit/s]
0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980
3	LoRa: SF9 / 125 kHz	1760
4	LoRa: SF8 / 125 kHz	3125
5	LoRa: SF7 / 125 kHz	5470
614	RFU	
15	Defined in [TS001] ⁴⁵	

Table 82: KR920-923 TX Data rate table

KR920-923 end-devices SHALL support the following data rates:

1. DR0 to DR5 (minimum set supported for certification)

All data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

_

⁴⁵ DR15 and TXPower15 are defined in the LinkADRReq MAC command of the LoRaWAN1.0.4 and subsequent specifications and were previously RFU

DRcurrent	DRnext	Comment
0	NA	Already the lowest data rate
1	0	
2	1	
3	2	
4	3	
5	4	

Table 83: KR920-923 Data Rate Backoff table

TXPower	Configuration (EIRP)

1	Max EIRP – 2dB		
2	Max EIRP – 4dB		
3	Max EIRP – 6dB		
4	Max EIRP – 8dB		
5	Max EIRP – 10dB		
6	Max EIRP – 12dB		
7	Max EIRP – 14dB		
814	RFU		
15	Defined in [TS001] ⁴⁵		

Table 84: KR920-923 TX power table

EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output power referenced to an isotropic antenna radiating power equally in all directions and whose gain is expressed in dBi.

By default, the Max EIRP is considered to be +14 dBm. If the end-device cannot achieve 14 dBm EIRP, the Max EIRP SHOULD be communicated to the network server using an out-of-band channel during the end-device commissioning process.

When the device transmits in a channel whose frequency is <922 MHz, the transmit power SHALL be limited to +10 dBm EIRP even if the current transmit power level set by the network server is higher.

2.11.4 KR920-923 Join-Accept CFList

The KR920-923 band LoRaWAN® implements an OPTIONAL **channel frequency list** (CFlist) of 16 octets in the Join-Accept message.

In this case the CFList is a list of five channel frequencies for the channels three to seven whereby each frequency is encoded as a 24 bits unsigned integer (three octets). All these channels are usable for DR0 to DR5 125 kHz LoRa modulation. The list of frequencies is followed by a single CFListType octet for a total of 16 octets. The CFListType SHALL be equal to zero (0) to indicate that the CFList contains a list of frequencies.

Size (bytes)	3	3	3	3	3	1
CFList	Freq Ch3	Freq Ch4	Freq Ch5	Freq Ch6	Freq Ch7	CFListType

The actual channel frequency in Hz is 100 x frequency whereby values representing frequencies below 100 MHz are reserved for future use. This allows setting the frequency of a channel anywhere between 100 MHz to 1.678 GHz in 100 Hz steps. Unused channels have a frequency value of 0. The **CFList** is OPTIONAL and its presence can be detected by the

1587 length of the join-accept message. If present, the CFList replaces all the previous channels 1588 stored in the end-device apart from the three default channels. The newly defined channels are immediately enabled and usable by the end-device for communication. 1589

2.11.5 KR920-923 LinkAdrReg command

The KR920-923 LoRaWAN® only supports a maximum of 16 channels. When ChMaskCntl field is 0 the ChMask field individually enables/disables each of the 16 channels.

1	592	
1	593

1603 1604 If the ChMaskCntl field value is one of values meaning RFU, the end-device SHALL⁴⁶ reject the command and unset the "Channel mask ACK" bit in its response.

2.11.6 KR920-923 Maximum payload size

The maximum MACPayload size length (M) is given by the following table for the regulation of dwell time; less than 4 sec with LBT. It is derived from limitation of the PHY laver depending on the effective modulation rate used taking into account a possible repeater encapsulation layer. The maximum application payload length in the absence of the OPTIONAL FOpts control field (N) is also given for information only. The value of N might be smaller if the **FOpts** field is not empty:

Data Rate	M	N	
0	59	51	
1	59	51	
2	59	51	
3	123	115	
4	230	222

Table 91: IN865-867 Join-Request Channel List

2.12.3 IN865-867 Data Rate and End-device Output Power Encoding

There is no dwell time or duty-cycle limitation for the INDIA 865-867 PHY layer. The *TxParamSetupReq* MAC command is not implemented by INDIA 865-867 devices.

The following encoding is used for Data Rate (DR) and End-device Output Power (TXPower) in the INDIA 865-867 band:

Data Rate	Configuration	Indicative physical
	_	bit rate [bit/s]

RP002-1.0.3 LoRaWAN® Regional Parameters

0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440
2	LoRa: SF10 / 125 kHz	980
3	LoRa: SF9 / 125 kHz	1760
4	LoRa: SF8 / 125 kHz	3125

814	RFU	
15	Defined in [TS001] ⁴⁸	

Table 92: IN865-867 TX Data rate table

1662 1663 1664

IN865-867 end-devices SHALL support one of the 2 following data rate options:

1665 1666 1667

1668 1669

1670 1671

1672

1. DR0 to DR5 (minimum set supported for certification) 2. DR0 to DR6 and DR7

For both of the options all data rates in the range specified SHALL be implemented (meaning no intermediate DR may be left unimplemented)

When the device is using the Adaptive Data Rate mode and transmits using the DRcurrent data rate, the following table defines the next data rate (DRnext) the end-device SHALL use during data rate back-off:

DRcurrent	DRnext	Comment
0	NA	Already the lowest data rate
1	0	
2	1	
3	2	
4	3	
5	4	
7	5

1710

- 1680 EIRP refers to the Equivalent Isotropically Radiated Power, which is the radiated output power 1681 referenced to an isotropic antenna radiating power equally in all directions and whose gain is 1682 expressed in dBi.
- By default, Max EIRP is considered to be 30 dBm. If the end-device cannot achieve 30 dBm EIRP, the Max EIRP SHOULD be communicated to the network server using an out-of-band channel during the end-device commissioning process.

2.12.4 IN865-867 Join-Accept CFList

- The India 865-867 band LoRaWAN® implements an OPTIONAL **channel frequency list** (CFlist) of 16 octets in the Join-Accept message.
- In this case the CFList is a list of five channel frequencies for the channels three to seven whereby each frequency is encoded as a 24 bits unsigned integer (three octets). All these channels are usable for DR0 to DR5 125 kHz LoRa modulation.
- The list of frequencies is followed by a single CFListType octet for a total of 16 octets. The CFListType SHALL be equal to zero (0) to indicate that the CFList contains a list of frequencies.

Size	3	3	3	3	3	1
(bytes)						
CFList	Freq Ch3	Freq Ch4	Freq Ch5	Freq Ch6	Freq Ch7	CFListType

The actual channel frequency in Hz is 100 x frequency whereby values representing frequencies below 100 MHz are reserved for future use. This allows setting the frequency of a channel anywhere between 100 MHz to 1.678 GHz in 100 Hz steps. Unused channels have a frequency value of 0. The **CFList** is OPTIONAL and its presence can be detected by the length of the join-accept message. If present, the **CFList** replaces all the previous channels stored in the end-device apart from the three default channels. The newly defined channels are immediately enabled and usable by the end-device for communication.

2.12.5 IN865-867 LinkAdrReg command

The INDIA 865-867 LoRaWAN® only supports a maximum of 16 channels. When **ChMaskCntl** field is 0 the ChMask field individually enables/disables each of the 16 channels.

ChMaskCntl	ChMask applies to				
0	Channels 0 to 15				
1	RFU				
2	RFU				
3	RFU				
4	RFU				
5	RFU				
6	All channels ON - The device SHOULD enable all currently defined channels				
	independently of the ChMask field value.				
7	RFU				

Table 95: IN865-867 ChMaskCntl value table

If the ChMaskCntl field value is one of values meaning RFU, the end-device SHALL⁴⁹ reject the command and unset the "**Channel mask ACK**" bit in its response.

2.12.6 IN865-867 Maximum payload size

The maximum **MACPayload** size length (*M*) is given by the following table. It is derived from limitation of the PHY layer depending on the effective modulation rate used taking into account a possible repeater encapsulation layer. The maximum application payload length in the absence of the OPTIONAL **FOpts** control field (*N*) is also given for information only. The value of N might be smaller if the **FOpts** field is not empty:

Data Rate	M	N	
0	59	51	
1	59	51	
2	59	51	
3	123	115	
4	230	222	
5	230	222	
7	230	222	
8:15	Not defined		

Table 96: IN865-867 maximum payload size (repeater compatible)

If the end-device will never operate with a repeater then the maximum application payload length in the absence of the OPTIONAL **FOpts** control field SHOULD be:

Data Rate	M	N	
0	59	51	
1	59	51	
2	59	51	
3	123	115	
4	250	242	
5	250	242	
7	250	242	
8:15	Not defined		

Table 97: IN865-867 maximum payload size (not repeater compatible)

1723 **2.12.7 IN865-867 Receive windows**

By default, the RX1 receive window uses the same channel as the preceding uplink. The data rate is a function of the uplink data rate and the RX1DROffset as given by the following table.

The allowed values for RX1DROffset are in the [0:7] range.

1727 Values in the [6:7] range allow setting the Downstream RX1 data rate higher than upstream data rate⁵⁰.

1729 The allowed values for RX1DROffset are in the [0:7] range, encoded as per the below table:

Upstream data rate			Do	wnstrea	m data ı	rate		
RX1DROffset	0	1	2	3	4	5	6	7
DR0	DR0	DR0	DR0	DR0	DR0	DR0	DR1	DR2
DR1	DR1	DR0	DR0	DR0	DR0	DR0	DR2	DR3
DR2	DR2	DR1	DR0	DR0	DR0	DR0	DR3	DR4
DR3	DR3	DR2	DR1	DR0	DR0	DR0	DR4	DR5
DR4	DR4	DR3	DR2	DR1	DR0	DR0	DR5	DR5
DR5	DR5	DR4	DR3	DR2	DR1	DR0	DR5	DR7
DR7	DR7	DR5	DR5	DR4	DR3	DR2	DR7	DR7

⁵⁰ DR7 is allowed in RX1 for IN865 since version RP2 1.0.0, in previous versions downlink data rate was limited to DR5 in RX1.

2.13 RU864-870 MHz Band

2.13.1 RU864-870 Preamble Format

1743 Please refer to Section 3.0 Physical Layer.

2.13.2 RU864-870 Band Channel Frequencies

The network channels can be freely attributed by the network operator in compliance with the allowed sub-bands defined by the Russian regulation. However, the two following default channels SHALL be implemented in every RU864-870 MHz end-device. Those channels are the minimum set that all network gateways SHALL be listening on.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	868.9 869.1	DR0 to DR5 / 0.3-5 kbps	2	<1%

Table 99: RU864-870 default channels

RU864-870 MHz end-devices SHALL be capable of operating in the 864 to 870 MHz frequency band and SHALL feature a channel data structure to store the parameters of at least 16 channels. A channel data structure corresponds to a frequency and a set of data rates usable on this frequency.

The first two channels correspond to 868.9 and 869.1 MHz / DR0 to DR5 and SHALL be implemented in every end-device. For devices compliant with TS001-1.0.x, those default channels SHALL NOT be modified through the *NewChannelReq* command. For devices compliant with TS001-1.1.x and beyond, these channels MAY be modified through the *NewChannelReq* but SHALL be reset during the backoff procedure defined in TS001-1.1.1 to guarantee a minimal common channel set between end-devices and network gateways.

The following table gives the list of frequencies that SHALL be used by end-devices to broadcast the Join-Request message. The Join-Request message transmit duty-cycle SHALL follow the rules described in chapter "Retransmissions back-off" of the LoRaWAN® specification document.

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	LoRa DR / Bitrate	Nb Channels
LoRa	125	868.9 869.1	DR0 – DR5 / 0.3-5 kbps	2

Table 100: RU864-870 Join-Request Channel List

2.13.3 RU864-870 Data Rate and End-device Output Power encoding

There is no dwell time limitation for the RU864-870 PHY layer. The *TxParamSetupReq* MAC command is not implemented in RU864-870 devices.

The following encoding is used for Data Rate (DR) and End-device EIRP (TXPower) in the RU864-870 band:

Data Rate	Configuration	Indicative physical bit rate [bit/s]
0	LoRa: SF12 / 125 kHz	250
1	LoRa: SF11 / 125 kHz	440

The beacon frame content is defined in [TS001].⁵⁵The beacon default broadcast frequency is 869.1 MHz.

1846 The class B default downlink pingSlot frequency is 868.9 MHz.

2.13.9 RU864-870 Default Settings

1848 There are no specific default settings for the RU864-870 MHz Band.

⁵⁵ Prior to LoRaWAN 1.0.4, the beacon was defined here as:

Size (bytes)	2	4	2	7	2
BCNPayload	RFU	Time	CRC	GwSpecific	CRC

-

Repeaters 1849 3

1853

- 1850 Repeaters have not yet been specified by the LoRa Alliance; however, the Regional
- Parameters specification does include references to repeaters and constraints which end-1851
- 1852 devices should follow to be compliant with them.

Repeater Compatible Maximum Payload Size

- 1854 Repeaters, as referenced in this specification, were intended to fully encapsulate a
- 1855 MACPayload in the ApplicationPayload of another LoRaWAN® data message. In addition to
- 1856 the original MACPayload, up to 20 bytes of meta-data describing the original message were
- 1857 envisioned to be included with the encapsulated data message. In order to minimize impact
- on the end-device and its application, repeaters would communicate with the network 1858
- 1859 (gateways) using only data rates that supported the maximum allowed MAC Payload Size of
- 1860 250 bytes. Thus, these data rates show a maximum payload size which is 20 bytes fewer
- 1861 when describing "Repeater Compatible" operation. 1862

1864

Physical layer

The LoRaWAN® uses a physical layer to communicate with other devices. Thee physical 1865 layers are currently supported through the LoRa™, LR-FHSS and FSK modulations. 1866

4.1 LoRa™ description 1867

1868 4.1.1 LoRa™ packet physical structure

LoRa™ messages use the radio packet explicit header mode in which the LoRa™ physical 1869 header (PHDR) plus a header CRC (PHDR_CRC) are included.⁵⁶ In explicit header mode the 1870 PHDR specifies: the payload length in bytes, the forward error correction rate, and the 1871 presence of an OPTIONAL CRC for the payload. The integrity of the payload is protected by 1872 a **CRC** for uplink messages. LoRaWAN® beacons are transmitted using LoRa™ modulation 1873 in implicit header mode with a fixed length. In implicit header mode neither the PHDR nor 1874 1875 PHDR CRC are present.

1876 The PHDR, PHDR CRC and payload CRC fields are inserted by the radio transceiver.

1877 PHY:

Size	8 Symbols	4.25 Symbols	8 Symbols		L bytes (from PHDR)	2 Bytes
Packet Structure	Preamble	Synchronization Word	PHDR	PHDR_CRC	PHYPayload	CRC (uplink only)
1878		Figure 3:	LoRa PHY str	ucture		

Figure 3: LoRa PHY structure

4.1.2 LoRa™ settings

In order to be fully compliant with LoRaWAN®, an end device SHALL configure the LoRa™ physical layer as follows:

1	881
1	882

1879 1880

Parameter	Uplink value	Downlink value	
Preamble size	8 symbols		
SyncWord	0x34 (l	Public)	
Header type	Explicit		
CRC presence	True False		
Coding Rate	4/5		
Spreading Factor	Defined by the data rate, specified in each region		
Bandwidth			
IQ polarization	Not-inverted Inverted		

1883

1885

Table 109: LoRa physical layer settings

1884 4.2 FSK description

4.2.1 FSK packet physical structure

1886 FSK messages can be built either by the software stack or by the hardware transceiver, 1887 depending on the end-device architecture.

1888 The **PHYPayload length** field contains the length in bytes of the **PHYPayload** field.

1889 The CRC field is computed on PHYPayload length and PHYPayload fields, using the CRC-1890 CCITT algorithm.

⁵⁶ See the LoRa radio transceiver datasheet for a description of LoRa radio packet implicit/explicit modes.

4.2.2 FSK settings

In order to be fully compliant with LoRaWAN®, an end device SHALL configure the FSK physical layer as follows:

1896 1897

Parameter	Uplink value	Downlink value	
Preamble size	5 bytes		
SyncWord	0xC1	94C1	
Bitrate	50000	bit/sec	
Tx frequency deviation	25 kHz	(SSB ⁵⁷)	
Rx bandwidth	50 kHz (SSB)		
Rx bandwidth AFC	80 kHz	z (SSB)	
CRC presence	True (CRC	-16-CCITT)	
Gaussian filter	BT = 1,0		
DC Free Encoding	Whitening Encoding		

1898 1899 Table 110: FSK physical layer settings

1900 1901

To avoid a non-uniform power distribution signal with the FSK modulation, a Data Whitening DC-Free data mechanism is used as shown in the above table.

1902

4.3 LR-FHSS description

1903 The Long Range Frequency Hopping Spread Spectrum (LR-FHSS) modulation is only used 1904 on the uplink.

1905 1906

4.3.1 LR-FHSS physical layer description

1907 1908

LR-FHSS is a fast frequency hopping spread spectrum (FHSS) modulation with bit rates ranging from 162bits/s to 325bits/s.

1909 1910

When a device transmits a packet using LR-FHSS on a given channel, the packet content is modulated across several pseudo-random frequencies than span the interval:

1911 1912 1913

$$F_{interval} = centrefreq \pm bw/2$$

1914 1915 For FCC 47 CFR Part 15 compliance, the end-device frequency hops across 60 physical channels on a 25.4 kHz frequency grid.

1916 1917 For ETSI based countries, the end-device frequency hops across 35 or 86 physical channels on a 3.9 kHz frequency grid.

1918

All physical channels are statistically used equally.

1919 1920

1921

1922

1923

The transmission starts on a random frequency inside the interval, and the following frequency hopping pattern is also randomly selected and announced in the LR-FHSS packet physical header. The transmission carrier frequency changes every 102.4 mSec for each payload fragment, and 233.472 mSec for each PHY header.

57 SSB: Single Side Bandwidth

1925 1926 The instantaneous LR-FHSS modulation bandwidth is 488 Hz. Therefore, a single LR-FHSS channel actually corresponds to lots of physical frequency channels.

1927

1928 1929

The LR-FHSS physical layer is described in the following table:

The LR-FHSS frequency hopping bandwidth is region specific.

1930 1931

LR-FHSS Frequency Hopping BW (all hops)	LR- FHSS BW of a single hop	Minimum separation between LR- FHSS hopping channels (grid)	Nb of physical channels usable for frequency hopping per end-device transmission	Nb of physical channels available for frequency hopping	Coding Rate	Physical bit rate
137 kHz	488 Hz	3.9 kHz	35	280 (8x35)	1/3	162bits/s
137 KIIZ	400 112	3.8 KHZ	33	200 (0,00)	2/3	325bits/s
336 kHz	488 Hz	3.9 kHz	86	688 (8x86)	1/3	162bits/s
JJU KHZ	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	ა.ყ K⊓Z	00	000 (000)	2/3	325bits/s
1.523 MHz	488 Hz	25.4 kHz	60	3120 (52x60)	1/3	162bits/s
1.023 NIUZ	400 FIZ	20.4 KHZ	80	3120 (32800)	2/3	325bits/s

1938 1939

1940

4.3.2 LR-FHSS packet physical structure

LR-FHSS uses redundant physical headers on different frequencies to improve the modulation robustness to in-band interferers. The number (N) of PHY headers is selectable on a packet per packet basis in the range 1 to 4.

A LR-FHSS packet has the following structure:

	-	
1	94	1

Repeated	N (1 to 4) times on different frequencies			once	
Size	114 bits with convolutional coding rate ½ on				
	(PHDR + PHRD_CRC), 2bits preamble and			I Putos (from DUDD)	2 Pyton
	interleaving			L bytes (IIOIII Phuk)	2 Bytes
	4 Bytes	4 Bytes	1 Byte		
Packet Structure	SyncWord	PHDR	PHDR_CRC	PHYPayload	CRC
Figure 5. LD EUCC Backet Christian					

1942 1943

Figure 5: LR-FHSS Packet Structure

1944 1945 A LR-FHSS packet time-on-air can be computed using the following table:

	PHY header	Payload + CRC
FEC	Conv ½	Conv 1/3 or 2/3
Bits per hop	114	16 info bits (CR=1/3) 32 (CR=2/3)
Time on air	N* 233.472 mSec	Ceil((L+3)/2)*102.4 msec (CR=1/3) ceil((L+3)/4)*102.4 msec (2/3)

1946

Figure 6: LR-FHSS time-on-air

1947

4.3.3 LR-FHSS PHY layer settings

In order to be fully compliant with LoRaWAN®, an end device SHALL configure the LRFHSS physical header as follows:

Parameter	Uplink value	
PHY header	N=4: NOT USED	
(SyncWord, PHDR,	N=3 when CR1/3 is used by the Payload	
PHDR_CRC) repetition	N=2 when CR2/3 is used by the Payload	
(<i>N</i>)	N=1: NOT USED	
SyncWord	0x2C0F7995	
Payload CRC	Enabled	
Data Rate	Specified in each region	
Coding Rate	1/3 or 2/3 -	
_	Defined by the DR, specified in each region	
Fraguency Hanning	25.4 kHz in FCC like regions	
Frequency Hopping Grid	3.9 kHz in other regions	
Gild	Defined by the DR, specified in each region	
Frequency hopping 137 kHz, 336 kHz or 1.523 MHz		
Bandwidth (OCW)	Defined by the DR, specified in each region	
Channel/hopping sequence	Randomly selected for each transmission

5 Revisions

1956 **5.1 Revision RP002-1.0.3**

- Add AS923-4 to cover 917-920 MHz (Israel)
- Add a clarifying note regarding DR6/DR7 for AS923/IN865
- 1959 LR-FHSS clarifications

1960 **5.2 Revision RP002-1.0.2**

- Added a summary table of the regional parameter for all regions except for CN470.
- "Repeater Compatible" rationale is described (Section 3) and US902-928, AU915-928 and CN470-520 maximum payload sizes for "repeater compatible" operation were amended (relaxed) for data rates which do not support encapsulation (this brings them into harmony with all other regions).
- LR-FHSS data rates added to EU868, US915, AU915. Data rate backoff progression explicitly documented for all regions. Data rate support requirements clarified for all regions.
- Align the language and descriptions of AS923 Maximum payload size section with that of all the other regions.
- Added language to all regions to align with new applications of NewChannelReq commands as of TS001-1.1.1.
- RU864-870 amended to indicate that 16 channels SHALL be supported. This was believed to have been an editorial oversight.
- Senegal (EU868), Montserrat (AU915), Mali (EU433), Guinea (EU433), Senegal (EU868), Syria (EU433, EU868, AS923-3) and Vanuatu (IN865 & AS923-3) added to cross-reference table
- Israel and Morocco cross-reference table entries modified
- Added a Channel Index ID to the Channel Plan Common Name Table
- Added AS923-1,-2,-3 to the Channel Plan Common Name Table
- Defined CLASS_B_RESP_TIMEOUT and CLASS_C_RESP_TIMEOUT (used in TS001-1.0.4 and later)

5.3 Revision RP002-1.0.1

- AS923 modified to support multiple groups of default/join channels. Each country/band supports a specific configuration based on an offset from the original AS923 default/join channels. Country summary table updated to indicate support.
- Cuba, Indonesia, Philippines, and Viet Nam channel plan use defined.
- Israel support for EU433 and AS923-3 were backed out as Israel MoC has
 deprecated their use for LoRaWAN® as of November 2019. A new 900 MHz band is
 under discussion with the MoC.
- Maximum Payload Size for AS923, Data Rate 2 was increased from 59 to 123 for UplinkDwellTime = 0 and DownlinkDwellTime = 0.
- CN470-510 modified to reflect most recent regulatory requirements. Specifically, SF12 is no longer available and maximum payload sizes for several other data rates were modified to comply with the 1 second dwell time. Further, a 500 kHz LoRa data rate and an FSK data rate were added.
- For dynamic channel plan regions, clarified that it is only by default that the RX1 frequency is the same as the uplink frequency.

2041

- Initial RP002-1.0.0 revision, the regional parameters were extracted from the released LoRaWAN® v1.1 Regional Parameters
- Added statement in Section 1 regarding non-authoritative source for regional regulatory information
- Added Section 2.2 RegParamsRevision common names table
- Added Regulatory Type Approval to quick reference table in Section 1
- Added Section 3 (changing this section to section 4) to incorporate changes from CR 00010.001.CR_add_physical_layer_description_Kerlink.docx of the TC21 meeting.
- Clarified Physical Header Explicit Mode (section 3.1)
- Require end-devices in AS923 to accept MaxPayload size downlinks as defined for DownlinkDwellTime=0, regardless of its actual configuration.
- Fixed several maxpayload tables when operating in "repeater compatible" mode, no MACPayload (M) may be larger than 230 bytes, regardless of dwell-time limitations
- Updated and clarified section 3, Physical Layer
- Normative language cleanup
- Removed Beacon format definition and referred back to LoRaWAN® specification
- Fixed the footnote for the US plan in section 2.5.3
- Added notes concerning the use of ARIB STD-T108 for AS923 end-devices in section 2.10.2
 - Migrated the CN470-510 channel plan from the RP 1.2rA draft
 - Clarified the wording of the footnotes regarding ChMaskCntl
 - Made AS923 use consistent in section 2.10
 - Changed SHOULD to SHALL in section 2.6.2
 - Changed footnote references to 1.0.2rC to 1.0.3rA
 - Changed table reference from 1.0.2rC to 1.0.2rB
 - Changed CN779 duty cycle from 0.1% to 1% as per Regional Regulation Summary
 - Reduced number of default channels for CN779 plan to 3 to make consistent with other plans
 - Changed RX1DROffset tables in sections 2.10.7 and 2.12.7 to be direct lookup tables.
 - Clarified/fixed errors in sections 2.10.7 and 2.12.7
 - Added default parameter definitions for Class B (referenced in LW)
 - Modified as per CR ACK TIMEOUT / RETRANSMIT TIMEOUT
 - Modified suggest New Zealand channel plan from EU868 to IN865
 - Modified Bangladesh and Pakistan channel plans from EU868 to IN865
 - Modified Singapore channel plan from EU868 to "Other"
- Updated Burma (Myanmar) channel plans from EU868 to "Other" and "Other" to AS923
 - Corrected typo error in channel plan for India Added and updated channel plans for Sri Lanka, Bhutan and Papua New Guinea,
 - Updated Middle East country suggested channel plan
 - Added channel plans for Samoa, Tonga and Vanuatu
 - Updated Bahrain and Kuwait channel plans
 - Corrected Qatar frequency range for EU868
- Updated channel plans for UAE: 870-875.8 MHz band can be used with EU868 channel plan
- Corrected frequency range for Lebanon from 862-870 MHz to 863-87 MHz
- Updated Africa priority one country suggested channel plan

RP002-1.0.3 LoRaWAN® Regional Parameters

- Added channel plans for the following African countries: Botswana, Burundi, Cabo
 Verde, Cameroon, Ghana, Ivory Coast, Kenya, Lesotho, Niger, Rwanda, Tanzania,
 Togo, Zambia, Zimbabwe
 - Corrected frequency range for Morocco from 867.6-869MHz to 868-869.65MHz
 - Updated frequency range for Tunisia (863-868MHz added)
 - Added EU433 for Nigeria and corrected frequency range from 863-870 to 868-870MHz
 - Added IN865 channel plan for Uganda
 - Updated Belarus and Ukraine channel plans (EU863-870 can be used)
 - Added EU433 channel plan for Costa Rica
 - Added channel plans for Suriname
 - Added or corrected bands for Albania, Denmark, Estonia, Hungary, Ireland, Liechtenstein, Luxembourg, Macedonia, Norway, Poland, Slovakia, Slovenia, Switzerland, UK: 918-921MHz changed to 915-918MHz!
 - Added channel plans for Trinidad and Tobago, Bahamas
 - Added channel plans for Aland Islands, Holy See, Monaco and San Marino
 - Fixed the AU entry in the Quick Reference Table
 - Italicized countries in the country table to highlight those whose regulations may be changing soon.
 - Finalized initial Regulatory Type Approval column with information based on LA survey of certified end device manufacturers.
 - Italicized Indonesia due to possible changes to regulatory environment there
 - Addressed inconsistencies in CN470
